**Regional ground-water-flow models of surficial sand and gravel aquifers along the Mississippi River between Brainerd and St. Cloud, central Minnesota** , **Advances in Hydrology and Climate Change** Surendra Kumar Chandniha,Anil Kumar Lohani,Gopal Krishan,Ajay Krishna Prabhakar,2022-11-24 Highlighting recent trends that employ innovative management and conservation approaches this volume provides an informative overview of the issues and challenges in water resources affected by climate change such as drought flooding glacier changes and overbuilt up urban areas Focusing on surface and groundwater related issues the book presents solutions that include such methods as morphometric assessment parameter estimation long term trend analysis sustainability indexes storm water management

models entropy based measurement of long term precipitation and more The volume focuses on providing a better understanding of climatic uncertainty through hydrometeorological data sets and their application in hydrological modeling These analyses help to serve as the basis for the design of flood control and water usage management policies Climate Change and Groundwater: Planning and Adaptations for a Changing and Uncertain Future Robert Maliva, 2021-01-26 This book attempts to bridge the gap between the climate change research and decision making communities by exploring the impacts of climate change on groundwater from a more applied perspective Global climate change will impact groundwater demands quality and available supplies and rising sea level may cause water tables to rise inundating low lying coastal areas Groundwater will increasingly be needed to perform a stabilization role in mitigating fluctuations in the supply of surface waters serving as a buffer against droughts Climate change has become a frequent subject in the mass media and the academic literature on the subject is now enormous An impediment to climate change adaptation with respect to water is a poor link between the climate change research community and the actual decision makers responsible for water supply planning Key issues explored are methods for evaluating potential impacts on climate change on local groundwater systems the adaptation of decision making process and how climate change adaptation can be mainstreamed into the water supply planning GIS and Geocomputation for Water Resource Science and Engineering Barnali Dixon, Venkatesh Uddameri, 2016-02-08 GIS and Geocomputation for Water Resource Science and Engineering not only provides a comprehensive introduction to the fundamentals of geographic information systems but also demonstrates how GIS and mathematical models can be integrated to develop spatial decision support systems to support water resources planning management and engineering The book uses a hands on active learning approach to introduce fundamental concepts and numerous case studies are provided to reinforce learning and demonstrate practical aspects The benefits and challenges of using GIS in environmental and water resources fields are clearly tackled in this book demonstrating how these technologies can be used to harness increasingly available digital data to develop spatially oriented sustainable solutions In addition to providing a strong grounding on fundamentals the book also demonstrates how GIS can be combined with traditional physics based and statistical models as well as information theoretic tools like neural networks and fuzzy set theory Modern Land Drainage Willem Vlotman, Lambert Smedema, David Rycroft, 2020-05-07 Modern Land Drainage 2nd edition is a fully revised and updated edition of the 2004 edition Modern Land Drainage describes traditional drainage formulas Hooghoudt Kirkham Donnan Ernst Glover Dumm for rainfed agriculture in the humid temperature zone Significant parts are devoted to drainage for salinity control of irrigated land in semi arid zones and to drainage of rice land in the humid tropics Institutional management and maintenance aspects are extensively covered as well as the mitigation of adverse impacts of drainage interventions on the environment The latest computer applications for drainage design in the context of integrated water management are described DRAINMOD HEC SWAP etc Field surveys are executed by governments with the aid of

consultants but rarely are the end stakeholders i.e. farmers and general public involved from inception to planning to execution of a drainage system. Yet during the Operation Management and Maintenance (OMM) phase of a water management system they are expected to takeover, run, bear and be responsible for the costs of OMM. The book describes successful methodologies and processes to be followed for engagement of stakeholders at all levels from government to farm, from minister to farmer and from beginning to end. The book covers all aspects needed for sustainable drainage. The latest survey methodologies with satellites and drones are suggested to assess cause and effect. Waterlogging and salinity are the effect of something caused most likely upstream of the drainage problem location. Hence treating the cause may be more cost effective. Triple Bottom Line (social, environmental and financial) considerations and the water-food-energy nexus are an integral part of the drainage design process. Controlled drainage i.e. the balance of removal and conservation of drainage water and minimising solute transport as low as reasonably achievable (ALARA) principle is extensively described. This work is intended for use both as a university level textbook and as a professional handbook; it is of particular value to professionals engaged in drainage development in the context of integrated water resources and river basin management: civil and agricultural engineers, government officials, university students and libraries.

**Anthropogenic Aquifer Recharge** Robert G. Maliva, 2019-05-07. The book is an overview of the diversity of anthropogenic aquifer recharge (AAR) techniques that use aquifers to store and treat water. It focusses on the processes and the hydrogeological and geochemical factors that affect their performance. This book is written from an applied perspective with a focus of taking advantage of global historical experiences both positive and negative as a guide to future implementation. Most AAR techniques are now mature technologies in that they have been employed for some time; their scientific background is well understood and their initial operational challenges and associated solutions have been identified. However, opportunities exist for improved implementation and some recently employed and potential future innovations are presented. AAR, which includes managed aquifer recharge (MAR), is a very important area of water resources management and there is no recent book that specifically and comprehensively addresses the subject.

**Modern Water Resources Engineering** Lawrence K. Wang, Chih Ted Yang, 2014-01-11. The Handbook of Environmental Engineering series is an incredible collection of methodologies that study the effects of pollution and waste in their three basic forms: gas, solid and liquid. This exciting new addition to the series, Volume 15 Modern Water Resources Engineering, has been designed to serve as a water resources engineering reference book as well as a supplemental textbook. We hope and expect it will prove of equal high value to advanced undergraduate and graduate students to designers of water resources systems and to scientists and researchers. A critical volume in the Handbook of Environmental Engineering series, chapters employ methods of practical design and calculation illustrated by numerical examples; include pertinent cost data whenever possible and explore in great detail the fundamental principles of the field. Volume 15 Modern Water Resources Engineering provides information on some of the most innovative and ground

breaking advances in the field today from a panel of esteemed experts
