Spannagel,2017-08-01 This thesis addresses two different topics both vital for implementing modern high energy physics experiments detector development and data analysis Providing a concise introduction to both the standard model of particle physics and the basic principles of semiconductor tracking detectors it presents the first measurement of the top quark pole mass from the differential cross section of tt J events in the dileptonic tt decay channel The first part focuses on the development and characterization of silicon pixel detectors To account for the expected increase in luminosity of the Large Hadron Collider LHC the pixel detector of the compact muon solenoid CMS experiment is replaced by an upgraded detector with new front end electronics It presents comprehensive test beam studies conducted to verify the design and quantify the performance of the new front end in terms of tracking efficiency and spatial resolution Furthermore it proposes a new cluster interpolation method which utilizes the third central moment of the cluster charge distribution to improve the position resolution The second part of the thesis introduces an alternative measurement of the top quark mass from the normalized differential production cross sections of dileptonic top quark pair events with an additional jet The energy measurement is 8TeV Using theoretical predictions at next to leading order in perturbative Quantum Chromodynamics QCD the top quark pole mass is determined using a template fit method **Manual of Determinative Mineralogy with an Introduction on Blow-Pipe Analysis** George J.
