

2017 USRDS Annual Data Report: Executive Summary

Kidney Disease – a Major Public Health Problem: End-Stage Renal Disease Treated by Dialysis or Transplantation is the Tip of the Iceberg!

This year marks the 28th publication of the Annual Data Report (ADR), a central and ever-evolving component of the United States Renal Data System (USRDS). The USRDS has developed into an internationally utilized resource—a world-class, comprehensive data system that supports high quality surveillance of kidney disease through a patient care, policy, and public health centered mission.

Why should we care about the trends and current state of kidney disease in the US? Research has established these as a disease continuum that holds great cost to both the individual and society. The key to success lies undoubtedly in the realm of prevention and optimal management of CKD in order to slow progression, with the goal of completely avoiding development of ESRD. This, for the most part, is an unmet challenge of the community focused on management of advanced kidney disease or ESRD.

A nexus clearly exists between kidney disease and common non-communicable diseases (NCDs), such as diabetes mellitus, hypertension, and obesity. It is therefore imperative that CKD (including ESRD) continues to be recognized as a major NCD, together with the obesity-metabolic syndrome-diabetes complex, hypertension and cardiovascular diseases, mental health disorders, cancer, and pulmonary diseases.

The onset of end-stage renal disease (ESRD) is easily identified when defined by the use of renal replacement therapies. In contrast, CKD is often silent or under-recognized and awareness in the general population is very low, even though it is readily identifiable through simple testing of blood and urine. Increasing awareness to promote timely recognition

and treatment has the potential to delay progression of the disease and reduce its complications.

Federal agencies have done much to raise awareness of kidney disease as a significant public health problem. Only few decades ago kidney failure was a fatal disease. When dialysis was developed and made available as a chronic therapy, lack of insurance coverage represented a barrier to treatment. This resulted in the passage of the landmark Medicare ESRD program in 1972 to fund ESRD care for all Americans.

In 1988, the National Institute of Diabetes and Digestive and Kidney Diseases (NIDDK) established The United States Renal Data System (USRDS), the largest and most comprehensive national, ESRD and CKD surveillance system. The initial USRDS Annual Data Reports (ADR) offered a detailed descriptive epidemiology of ESRD. A chapter addressing CKD was introduced in 2003, and was subsequently expanded into a multi-chapter CKD volume from 2008 onward.

Since 2000, CKD has received increasing attention. The consensus definition and staging classification of CKD / KDOQI Clinical Practice Guidelines for Chronic Kidney Disease: Evaluation, Classification, and Stratification were first published in 2002. That year also marked the launch of NIDDK's National Kidney Disease Education Program (NKDEP). NKDEP provides information for patients and providers regarding the detection of CKD and care of people with the disease. In 2006, the Centers for Disease Control and Prevention launched a broad CKD initiative, with the CDC CKD Surveillance System as its major component. This project prioritizes the earlier stages of CKD as opposed to ESRD or the late
