*Optimality in Biological and Artificial Networks?* Daniel S.

Levine, Wesley R. Elsberry, 2013-06-17 This book is the third in a series based on conferences sponsored by the Metroplex Institute for Neural Dynamics an interdisciplinary organization of neural network professionals in academia and industry The topics selected are of broad interest to both those interested in designing machines to perform intelligent functions and those interested in studying how these functions are actually performed by living organisms and generate discussion of basic and controversial issues in the study of mind The topic of optimality was chosen because it has provoked considerable discussion and controversy in many different academic fields There are several aspects to the issue of optimality First is it true that actual behavior and cognitive functions of living animals including humans can be considered as optimal in some sense Second what is the utility function for biological organisms if any and can it be described mathematically Rather than organize the chapters on a biological versus artificial basis or by what stance they took on optimality it seemed more natural to organize them either by what level of questions they posed or by what intelligent functions they dealt with The book begins with some general frameworks for discussing optimality or the lack of it in biological or artificial systems The next set of chapters deals with some general mathematical and computational theories that help to clarify what the notion of optimality might entail in specific classes of networks The final section deals with optimality in the context of many different high level issues including exploring one's environment understanding mental illness linguistic communication and social organization The diversity of topics covered in this book is designed to stimulate interdisciplinary thinking and speculation about deep problems in intelligent system organization     *Introduction to Neural and Cognitive Modeling* Daniel S.

Levine, 2018-10-26 This textbook provides a general introduction to the field of neural networks Thoroughly revised and updated from the previous editions of 1991 and 2000 the current edition concentrates on networks for modeling brain processes involved in cognitive and behavioral functions Part one explores the philosophy of modeling and the field's history starting from the mid 1940s and then discusses past models of associative learning and of short term memory that provide building blocks for more complex recent models Part two of the book reviews recent experimental findings in cognitive neuroscience and discusses models of conditioning categorization category learning vision visual attention sequence learning behavioral control decision making reasoning and creativity The book presents these models both as abstract ideas and through examples and concrete data for specific brain regions The book includes two appendices to help ground the reader one reviewing the mathematics used in network modeling and a second reviewing basic neuroscience at both the neuron and brain region level The book also includes equations practice exercises and thought experiments     *Digital Design from Zero to One* Jerry D.
