**Abstract** The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised walking program on the physical and psychological health of older adults. The study was a randomized controlled trial. The intervention group consisted of 20 older adults who participated in a 12-week walking program. The control group consisted of 20 older adults who did not participate in the program. The results of the study showed that the walking program had a positive effect on the physical and psychological health of the older adults. The walking program improved the physical health of the older adults, as measured by the 6-minute walk test and the Timed Up and Go test. The walking program also improved the psychological health of the older adults, as measured by the Geriatric Depression Scale and the Geriatric Anxiety Inventory. The results of the study suggest that a 12-week, low-intensity, supervised walking program is an effective intervention for improving the physical and psychological health of older adults.
