Course ,1984 Data Stream Management Lukasz Golab,M. Tamer Ozsu,2022-06-01 Many applications process high
volumes of streaming data among them Internet traffic analysis financial tickers and transaction log mining In general a data
stream is an unbounded data set that is produced incrementally over time rather than being available in full before its
processing begins In this lecture we give an overview of recent research in stream processing ranging from answering simple
queries on high speed streams to loading real time data feeds into a streaming warehouse for off line analysis We will discuss
two types of systems for end to end stream processing Data Stream Management Systems DSMSs and Streaming Data
Warehouses SDWs A traditional database management system typically processes a stream of ad hoc queries over relatively
static data In contrast a DSMS evaluates static long running queries on streaming data making a single pass over the data
and using limited working memory In the first part of this lecture we will discuss research problems in DSMSs such as
continuous query languages non blocking query operators that continually react to new data and continuous query
optimization The second part covers SDWs which combine the real time response of a DSMS by loading new data as soon as
they arrive with a data warehouse s ability to manage Terabytes of historical data on secondary storage Table of Contents
