

Using and Making a Biological Key

Classification is a way of separating a large group of closely related organisms into smaller subgroups. Classification makes everyday life easier by putting organisms in a useful system. Classification helps us to group the organisms we live with every day. Classification also lets us have a system for reference and will continue to help as we study the organisms around us. The scientific names of organisms are based on the classification systems of living organisms. To classify an organism, scientists often use a taxonomic key that lists specific characteristics, such as structure and behavior, in such a way that an organism can be identified.

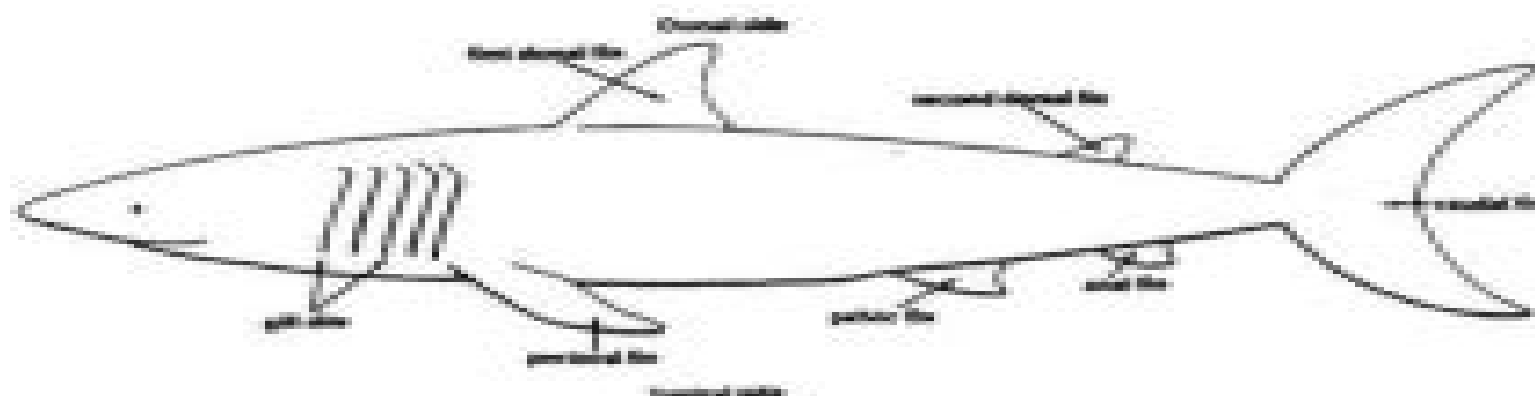

Essential Question: Will you be able to organize a lot of 14 sharks using a taxonomic key?

Hypothesis: If I follow the taxonomic key, I will be able to identify the 14 pictured sharks.

Materials: Ruler, Shark data sheet, taxonomic key, paper, pencil

Procedure:

1. Use the figure below as a guide to the shark parts used in the taxonomic key on the next page.
2. Read sentences 1A and 3B of the key then shade Shark 1 on your data sheet. Follow the directions in the sentences and continue until you determine the family name of the Shark.
3. Continue this process for each shark on the data sheet until you have identified the family for all of them.

Playing against Nature Seth Stein,Jerome Stein,2014-04-09 Defending society against natural hazards is a high stakes game of chance against nature involving tough decisions How should a developing nation allocate its budget between building schools for towns without ones or making existing schools earthquake resistant Does it make more sense to build levees to protect against floods or to prevent development in the areas at risk Would more lives be saved by making hospitals earthquake resistant or using the funds for patient care What should scientists tell the public when as occurred in L Aquila Italy and Mammoth Lakes California there is a real but small risk of an upcoming earthquake or volcanic eruption Recent hurricanes earthquakes and tsunamis show that society often handles such choices poorly Sometimes nature surprises us when an earthquake hurricane or flood is bigger or has greater effects than expected from detailed hazard assessments In other cases nature outsmarts us doing great damage despite expensive mitigation measures or causing us to divert limited resources to mitigate hazards that are overestimated Much of the problem comes from the fact that formulating effective natural hazard policy involves combining science economics and risk analysis to analyze a problem and explore the costs and benefits of different options in situations where the future is very uncertain Because mitigation policies are typically chosen without such analysis the results are often disappointing This book uses general principles and case studies to explore how we can do better by taking an integrated view of natural hazards issues rather than treating the relevant geoscience engineering economics and policy formulation separately Thought provoking questions at the end of each chapter invite readers to confront the complex issues involved Readership Instructors researchers practitioners and students interested in geoscience engineering economics or policy issues relevant to natural hazards Suitable for upper level undergraduate or graduate courses Additional resources can be found at <http://www.wiley.com/go/Stein/Playingagainstnature>
