and his team this book provides a comprehensive overview of hydrogen production conversion and storage offering the scientific literature a comprehensive coverage of this important fuel Continually growing environmental concerns are driving every or almost every country on the planet towards cleaner and greener energy production This ultimately leaves no option other than using hydrogen as a fuel that has almost no adverse environmental impact But hydrogen poses several hazards in terms of human safety as its mixture of air is prone to potential detonations and fires In addition the permeability of cryogenic storage can induce frostbite as it leaks through metal pipes In short there are many challenges at every step to

strive for emission free fuel In addition to these challenges there are many emerging technologies in this area For example as the density of hydrogen is very low efficient methods are being developed and engineered to store it in small volumes This groundbreaking new volume describes the production of hydrogen from various sources along with the protagonist materials involved Further the extensive and novel materials involved in conversion technologies are discussed Also covered here are the details of the storage materials of hydrogen for both physical and chemical systems Both renewal and non renewal sources are examined as feedstocks for the production of hydrogen The non renewal feedstocks mainly petroleum are the major contributor to date but there is a future perspective in a renewal source comprising mainly of water splitting via electrolysis radiolysis thermolysis photocatalytic water splitting and biohydrogen routes Whether for the student veteran engineer new hire or other industry professionals this is a must have for any library
