In recent times real time computer systems have become increasingly complex and sophisticated. It has now become apparent that to implement such schemes effectively professional rigorous software methods must be used. This includes analysis, design, and implementation. Unfortunately, few textbooks cover this area well. Frequently they are hardware oriented with limited coverage of software or software texts which ignore the issues of real time systems. This book aims to fill that gap by describing the total software design and development process for real time systems. Further, special emphasis is given to microprocessor based real time embedded systems to meet the needs. WHAT ARE REAL TIME COMPUTER SYSTEMS? Real time systems are those which must produce correct responses within a definite time limit. Should computer responses exceed these time bounds, then performance degradation and/or malfunction results. WHAT ARE REAL TIME EMBEDDED COMPUTER SYSTEMS? Here the computer is merely one functional element within a real time system; it is not a computing machine in its own right. WHO SHOULD READ THIS BOOK? Those involved or who intend to get involved in the design of software for real time systems. It is written with both software and hardware engineers in mind, being suitable for students and professional engineers. **Software Engineering Education** Rosalind L. Ibrahim, 1995-02-17 This volume constitutes the proceedings of the 8th Conference on Software Engineering Education (SEE) held in New Orleans, Louisiana, USA, in March/April 1995. The volume presents 25 carefully selected full papers by researchers, educators, trainers, and managers from the relevant academic, industrial, and governmental communities. In addition, there are abstracts of keynote speeches, panels, and tutorials. The topics covered include curriculum issues, Goals: what should we be teaching?
