Medical Image Computing and Computer-Assisted Intervention - MICCAI 2002 Takeyoshi Dohi,Ron Kikins,2003-06-30 The fifth international Conference in Medical Image Computing and Computer Assisted Intervention MICCAI 2002 was held in Tokyo from September 25th to 28th 2002 This was the first time that the conference was held in Asia since its foundation in 1998 The objective of the conference is to offer clinicians and scientists the opportunity to collaboratively create and explore the new medical field Specifically MICCAI offers a forum for the discussion of the state of art in computer assisted interventions medical robotics and image processing among experts from multi disciplinary professions including but not limited to clinical doctors computer scientists and mechanical and biomedical engineers The expectations of society are very high the advancement of medicine will depend on computer and device technology in coming decades as they did in the last decades We received 321 manuscripts of which 41 were chosen for oral presentation and 143 for poster presentation Each paper has been included in these proceedings in eight page full paper format without any differentiation between oral and poster papers Adherence to this full paper format along with the increased number of manuscripts surpassing all our expectations has led us to issue two proceedings volumes for the first time in MICCAI s history Keeping to a single volume by assigning fewer pages to each paper was certainly an option for us considering our budget constraints However we decided to increase the volume to offer authors maximum opportunity to argue the state of art in their work and to initiate constructive discussions among the MICCAI audience

Ventricular Mechanics in Congenital Heart Disease Giovanni Biglino,Adelaide de Vecchi,2017-08-29 Looking at Horse in Motion the iconic photograph by E Muybridge it is almost possible to hear the horse galloping The pounding sound of the hoofs hitting the ground like a drum can also echo the rythmic beating of the human heart That sound that visceral rhythm reminds us of the link between motion and performance the perfectly executed stride of the horse the incredible coordination of multiscale phenomena behind a heart beat Furthermore the decomposed sequence in Muybridge s photograph has become a well known example of breaking motion into its components over time and as such is reminiscent of those images that are routinely acquired in clinical practice where the heart appears dilating and shirinking in a sequence of snapshots The investigation of this motion and its subtleties is essential for refining our understanding of cardiac function and the appreciation of how and when this motion is no longer perfectly executed can lead us to understand functional impairments and provide insight into the unfolding of pathology In the presence of congenital heart disease CHD cardiac mechanics are

altered from single ventricle physiology to conduction abnormalities to different cardiomyopathies it is important to both capture and interpret biomechanical changes that occur in the presence of a congenital defect This special issue in *Frontiers in Pediatrics* now an e book focuses on Ventricular mechanics in congenital heart disease and looks at current knowledge of phenomena such as systolic diastolic dysfunction and current methods chiefly in cardiovascular magnetic resonance imaging and echocardiography to evaluate cardiac function in the presence of CHD and then presents a series of original studies that employ both medical imaging and computational modelling techniques to study specific CHD scenarios

Dynamic Functional Connectivity in Neuropsychiatric Disorders: Methods and Applications, volume II Zaicu Cui, Feng Liu, Wenbin Guo, Yuqi Cheng, Zhifen Liu, 2023-06-07 Neuropsychiatric disorders have a huge impact on individuals families and societies However the neuropathology underlying cognitive deficits in neuropsychiatric disorders remains unclear Resting state functional connectivity provides a powerful way to investigate functional alterations underlying cognitive deficits in neuropsychiatric disorders Traditional FC analysis measures the correlations of signals with an assumption that functional connectivity remains constant during the observation period In recent years several studies have demonstrated the feasibility of dynamic methods in characterization of functional brain changes such as dynamic functional connectivity investigated by a sliding window method However selection of window size window stepsize and window type are open areas of research and an important parameter to capture the resting state FC dynamics
