**Physics of Laser Crystals** Jean-Claude Krupa, Nicolay A. Kulagin, 2003-11-30 Physics of laser crystals has been constantly developing since the invention of the laser in 1960 Nowadays more than 1500 wide band gap and semiconductor crystals are suitable for the production of the laser effect Different laser devices are widely used in science medicine and communication systems according to the progress achieved in the development of laser crystal physics Scintillators for radiation detection also gained benefit from these developments Most of the optically active materials offer laser radiations within the 500 to 3000 nm region with various quantum efficiency which fit the usual applications However new crystals for laser emissions are needed either in the blue UV and VUV region or far IR region especially for medicine computer microchip production and for undiscovered practical uses Scientific problems of the growth and properties of laser crystals are discussed in numerous books and scientific journals by many scientists working in the field Therefore we thought that joint discussions of the scientific and technical problems in laser physics will be useful for further developments in this area We have proposed to hold a Workshop on Physics of Laser Crystals for attempting to induce additional advances especially in

solid state spectroscopy This NATO Advanced Research Workshop ARW was held in Kharkiv, Stry Salto, Ukraine on August 26-September 2, 2002 and was mainly devoted to the consideration of modern approaches and latest results in physics of laser crystals *Physics Express*, 1969

**E. T. Jaynes: Papers on Probability, Statistics and Statistical Physics** R. D. Rosenkrantz, 2012-12-06

The first six chapters of this volume present the author's predictive or information theoretic approach to statistical mechanics in which the basic probability distributions over microstates are obtained as distributions of maximum entropy, i.e., as distributions that are most non-committal with regard to missing information among all those satisfying the macroscopically given constraints. There is then no need to make additional assumptions of ergodicity or metric transitivity; the theory proceeds entirely by inference from macroscopic measurements and the underlying dynamical assumptions. Moreover, the method of maximizing the entropy is completely general and applies in particular to irreversible processes as well as to reversible ones. The next three chapters provide a broader framework at once Bayesian and objective for maximum entropy inference. The basic principles of inference, including the usual axioms of probability, are seen to rest on nothing more than requirements of consistency: above all, the requirement that in two problems where we have the same information we must assign the same probabilities. Thus statistical mechanics is viewed as a branch of a general theory of inference, and the latter as an extension of the ordinary logic of consistency. Those who are familiar with the literature of statistics and statistical mechanics will recognize in both of these steps a genuine scientific revolution, a complete reversal of earlier conceptions, and one of no small significance.
