

Opinion answers provided by Isabel Cisneros, Diana Pham, Karen Moxcey and others and later checked by Mr. Jasmann

Nuclear Power Webquest APES

1. Uranium -235 decays naturally by alpha radiation and releases an alpha particle (two neutrons and two protons bound), it undergoes spontaneous fission a small percentage of the time but what makes it special is it can undergo induced fission, the nucleus absorbs free neutrons and causes it to split.
2. Heat and gamma radiation (high energy photons) is released when atoms split; beta radiation is also released after the fission. The energy released from one fission is less than how much the original U-235 atom weights so the difference in weight is converted directly to energy at a rate governed by the equation $E = mc^2$.
- 3.

Picture with letters at: <http://science.howstuffworks.com/nuclear-power3.htm>

- A. **Containment structure:** contains where the reaction occurs, holding the control rods, reactor, and steam generator. Uranium pellets are arranged in rods, together in bundles, which are submerged in water inside a pressure valve.
 - B. **Control rods:** in the uranium bundles, which absorb neutrons and raise or lower the control rods, controlling the nuclear reaction rate (rods raised out when more heat is wanted).
 - C. **Reactor:** where the bundles are lowered to cause a reaction.
 - D. **Steam generator:** where water is heated to create steam.
 - E. **Steam line:** where the steam is carried to the turbine.
 - F. **Pump:** pumps in water to be heated.
 - G. **Generator:** Produces the power.
 - H. **Turbine:** spins the generator to produce power.
 - I. **Cooling water condenser:** Function below.
 - J. **Cooling tower:** I and J is the Cooling Tower which sucks in cold water from a pond and pumps it within the turbine area to cool/condense the steam back into liquid water to be returned to the steam generator.
4. **Critical mass:** If, on average, exactly one of the free neutrons from each fission hits another U-235 nucleus and causes it to split, then the mass of uranium is said to be critical. The mass will exist at a stable temperature.
