

where k is the spring constant, B is the magnetic field, μ_0 is the permeability of free space.

Three marks questions & answers

1. Derive the expression for magnetic force in a current carrying conductor. $(4 \times 2 = 8)$
 Consider a rod of a uniform cross-sectional area A and length l put in the uniform density of charge carrier of free electrons n .
 Then the total number of mobile charge particles is nAl . Assume that these charge carriers are under motion with a drift velocity v_d .
 So the drift velocity is v_d then the charge of each charge carrier is q .
 So the total magnetic force is $F = nAlqv_d$.
 But the current density is $J = nqv_d$.

\therefore $F = BIl$

But J is the drift current in the conductor. Then

100% correct

2. Obtain the expression for radius of circular path considered by a charge in a magnetic field.

Assume that a charge particle of q is moving perpendicular to the uniform magnetic field B .
 The magnetic force $F = qvB$ acts as a centripetal force. Then producing a uniform circular motion for the particle in a plane perpendicular to the field.

So $qvB = \frac{mv^2}{r}$ where m is the mass of the particle. r is the radius of the circular path.

100% correct

3. State and explain the Lorentz force.
