

Problem 3.19

A balanced to unbalanced (balun) transformation is often needed to connect a dipole antenna (balanced) to a coaxial cable (unbalanced). The following figure depicts the basic concept.

As an alternative of using a transformer, one often uses the following antenna connection.

- Explain why one leg of the dipole antenna is connected a distance $\lambda/4$ away from the end of the coax cable.
- For an FM broadcast band antenna in the frequency range from 88 to 108 MHz, find the average length where the connection has to be made.

Solution

- In order to ensure that the lower leg has a high impedance with respect to ground, a lambda-quarter transformer is used. Thus the short circuit at the ground connection is transformed into a high impedance point, thereby maintaining a balanced connection to the antenna. The disadvantage of an arrangement like this is that a certain amount of radiation takes place. As an alternative, a lambda-quarter long sleeve is electrically connected to the shield of the coax cable (short circuit) and left open at the end of the cable (infinite). The standing wave established within the sleeve allows a minimal amount of radiation.
- The average frequency is $f_{\text{ave}} = 88\text{MHz} + (108\text{MHz} - 88\text{MHz})/2 = 98\text{MHz}$. Therefore, $l = \lambda/4 = f_{\text{ave}}/(4c) = 8.17\text{cm}$.

Problem 3.20

Using the 20-Smith Chart, find the input impedance of the following network at 2 GHz.

What is the input impedance of this network at 1 GHz?

Solution

The solution requires the steps outlined in Section 3.4.3. The characteristic impedance can
