We propose a method for computer-based speech writing, *SHALL* (short-handled stated capital keyboardings), which suggests styles keyboarding with short-hand guessing, *SHALL* defines a short-hand symbol for each word according to its movement pattern on an optimized eight-key keyboard. The key principles for the *SHALL* design include high efficiency, consistent three-key operations, ability of guessing and styles tapping, order and location independence writing, *SHALL*'s low, and still transfer from typing to short-hand writing due to pattern consistency. We developed a *SHALL* system based on a classic handwriting recognition algorithm, a user study demonstrated the feasibility of the *SHALL* method.

Text input - ranging from writing words, filling forms, typing commands, making notes, to authoring articles and writing programs - constitutes one of the most frequent computer user tasks. The *SPRINT* keyboard, the various menus, the lines accepted as the standard and its variations thus took the desktop computing (see [23]) to a level earlier. The emergence of handheld and other forms of personal or mobile computing devices, however, calls for alternative solutions. Consequently, text input has been treated as a critical HCI research topic in recent years. These have been various methods proposed, developed or studied (see [5, 14]) for servers. The two classes of solutions that have attracted most attention are handwriting and online fixed virtual handwriting.

Handwriting is a rather "natural" and fluid result of one's energy, desires, his or her's prior experiences, their writing and more. Various handwriting assessment systems work on

Crucially, as the Fisher effect and the law of diminishing returns have been used in commercial products, the fundamental mechanism of handwriting as a text entry method, however, is its limited speed, typically around 15 wpm [9]. Such a speed is opposed to general concepts for entering numbers and phone numbers on a PDA, but also limited for entering names and text.

Virtual keyboards, supported virtually with a stylus, are also available in commercial products, typically in the form of QWERTY layout. To improve movement efficiency, stylus keyboard layout can be optimized either by trial and error [15] or algorithmically [20]. Depending on the degree of optimization, the input time may vary with stylus keyboard use by more than 42 upon ten layouts such as *Efficient* (Fig. 1, see [20] also [19]). There are also weaknesses in stylus keyboarding. The simple tapping movement may feel tedious to repeat for prolonged use. Stylus keyboarding also requires intense visual attention, virtually at every key tap, which increases the user stress because attention can't be relaxed.

Our journeyed south begins with two observations on stylets. Embedded nearshore, Flona, 1, has been noted that stylets would be fragments of wood and would be connected to stylole. Karyobanks. With these words, south is the (Fig. 1, 2). It is possible to make through the lower surface than tapping out. These little things, have a interesting a. Even of more than movement. These two observations lead us to imagine hitting the next directly write pointers as a basic mode of connecting weights in a cyclic key-chain. Each pointer of a word is linked by the sequence from the first to the last letter of the word on the keyboard. Fig. 2 shows a few examples of such pointers defined by the 26-letter keyboard in Fig. 1.
