**Characterization of Solid Surfaces** Philip F. Kane,Graydon B. Larrabee,2013-11-27 Until comparatively recently trace analysis techniques were in general directed toward the determination of impurities in bulk materials Methods were developed for very high relative sensitivity and the values determined were average values Sampling procedures were devised which eliminated the so called sampling error However in the last decade or so a number of developments have shown that for many purposes the distribution of defects within a material can confer important new properties on the material Perhaps the most striking example of this is given by semiconductors a whole new industry has emerged in barely twenty years based entirely on the controlled distribu tion of defects within what a few years before would have been regarded as a pure homogeneous crystal Other examples exist in biochemistry metallurgy polyinners and of course catalysis In addition to this of the importance of distribution there has also been a recognition growing awareness that physical defects are as important as chemical defects We are of course using the word defect to imply some dis continuity in the material and not in any derogatory sense This broadening of the field of interest led the Materials Advisory Board I to recommend a new

definition for the discipline Materials Characterization to encompass this wider concept of the determination of the structure and composition of materials In characterizing a material perhaps the most important special area of interest is the surface
