GUIDED NOTES

10 BACTERIA

Definition: Bacteria are single-celled microorganisms that are found everywhere. They are the simplest form of life and can be found in almost every environment. They are responsible for many diseases and are also used in the production of food and medicine.

CLASSIFYING BACTERIA

Bacteria are classified based on their shape and the way they move. The three main shapes are spherical (cocci), rod-shaped (bacilli), and spiral (spirilla). They can move on their own or be carried by the wind or water.

REPRODUCTION

Bacteria reproduce by binary fission, which means they split into two. This process is very fast and can happen in a matter of hours. Some bacteria can also form spores, which are tiny, hardy structures that can survive in harsh conditions for a long time.

11 VIRUSES

Definition: Viruses are tiny particles that can only be seen with a powerful microscope. They are not made of cells and cannot reproduce on their own. They need a host cell to reproduce and can cause many diseases.

STRUCTURE

Viruses have a simple structure. They consist of a central core of genetic material (DNA or RNA) surrounded by a protective protein coat called a capsid. Some viruses also have a lipid envelope.

REPRODUCTION

Viruses reproduce by attaching to a host cell and injecting their genetic material. The host cell then produces new virus particles, which can go on to infect other cells.
