Casadesus, 2011-07-05 Animals have been used to model diseases or test new treatments since around 300 BC and undoubtedly our ability to model disease in animals including transgenic animals has provided major breakthroughs in all fields of biomedical research Due to their complexity and plurality of pathology and symptomatology the study of neurodegenerative diseases relies heavily on animal models These models have been developed in many species in the attempt to uncover the complex nature of the disease mechanisms involved The ultimate goal is to test promising therapies and to manage prevent or cure neurodegenerative disease But because most animal models in this area do not reproduce the full phenotypical disease spectrum and the etiology and clinical presentation of neurodegenerative diseases differ from one patient to the next the testing of these diseases in animal models often translates poorly to indices of efficacy when applied to the clinical population Written by experts in the field with these advances and challenges in mind this handbook provides an updated overview of the animal models being developed and used to study complex disease dynamics The first part of the book presents an overview of animal models of various species and includes a review of new invertebrate animal models to study neurodegeneration The

second section presents the use of animal models to pinpoint disease mechanisms and the last part of the handbook examines the various therapeutic interventions being used in models of neurodegenerative disease

Biological Electron Microscopy Michael J. Dykstra, Laura E. Reuss, 2011-06-28

Electron microscopy is frequently portrayed as a discipline that stands alone separated from molecular biology light microscopy physiology and biochemistry among other disciplines It is also presented as a technically demanding discipline operating largely in the sphere of black boxes and governed by many absolute laws of procedure At the introductory level this portrayal does the discipline and the student a disservice The instrumentation we use is complex but ultimately understandable and more importantly repairable The procedures we employ for preparing tissues and cells are not totally understood but enough information is available to allow investigators to make reasonable choices concerning the best techniques to apply to their particular problems There are countless specialized techniques in the field of electron and light microscopy that require the acquisition of specialized knowledge particularly for interpretation of results electron tomography and energy dispersive spectroscopy immediately come to mind but most laboratories possessing the equipment to effect these approaches have specialists to help the casual user The advent of computer operated electron microscopes has also broadened access to these instruments allowing users with little technical knowledge about electron microscope design to quickly become operators This has been a welcome advance because earlier instruments required a level of knowledge about electron optics and vacuum systems to produce optimal photographs and to avoid crashing the instruments that typically made it difficult for beginners
