

Simple Harmonic Motion: A Spring and the Simple Harmonic Oscillator

What is **simple harmonic motion** (SHM), which means that the force exerted by the spring is proportional to the displacement of the mass from the spring's rest length?

$$F = -kx$$

A coiled spring exerts a force that is a function of the position of the spring. The simplest function that describes the force is proportional to the distance of the displacement. For the 1D system, the force of spring exerted is just $F = -kx$. The displacement is equal to the angle of displacement, $\sin \theta \approx \theta$. The displacement of the mass is $x = A \cos(\omega t)$ and the spring force is $F = -kx = -kA \cos(\omega t)$. If the spring is compressed, then x is

negative the spring force is $F = kx$.

Simple harmonic motion occurs whenever there is a restoring force which is proportional to the displacement from equilibrium, as in the example. Assuming no friction, there are no damping and the spring is constant. The equation of motion is:

$$m \frac{d^2 x}{dt^2} = -kx \quad \text{or} \quad \frac{d^2 x}{dt^2} = -\frac{k}{m} x$$

The solution of this second-order differential equation is:

$$x(t) = A \cos(\omega t + \phi) \quad \text{or} \quad \omega = \sqrt{\frac{k}{m}}$$

where A is the arbitrary constant which depends on the initial conditions, the initial position and initial velocity of the mass. The period of the spring is T , which means it can return to:

$$x(t) = A \cos(\omega t + \phi) = A \cos(\omega(t + T) + \phi)$$

Then the period T is given by:

$$T = 2\pi \sqrt{\frac{m}{k}}$$

is an important property of simple harmonic motion as the period of T does not depend on the amplitude of the motion, A .

Thus, $\omega = 2\pi/T$.
