Section: Water Use and Management

Read the passage below and answer the questions that follow.

Industry accounts for 19 percent of water used in the world. Water is used to manufacture goods, to dispose of waste, and to generate power. The amount of water needed to manufacture everyday items can be astounding. For instance, nearly 1,000 L of water are needed to produce 1 kg of aluminum, and almost 500,000 L of water are needed to manufacture a car. Vast amounts of water are required to produce computer chips and semiconductors.

Most of the water that is used in industry is used to cool power plants. Power-plant cooling systems usually pump water from a surface water source such as a river or lake, carry the water through pipes in a cooling tower, and then pump the water back into the source. The water that is returned is usually warmer than the source, but it is generally clean and can be used again.

IDENTIFYING MAIN IDEAS

One reading skill is the ability to identify the main idea of a passage. The main idea is the main focus or key idea. Frequently, a main idea is accompanied by supporting information that offers detailed facts about main ideas.

In the space provided, write the letter of the term or phrase that best completes each statement or best answers each question.

- _____ 1. How much water is needed to manufacture a car?
a. 50,000 L
b. 500,000 L
c. 1,000 L
d. 100,000 L
- _____ 2. The amount of water used in the world for industry is
a. 500,000 L.
b. vast amounts.
c. 19 percent.
d. 1,000 L.
- _____ 3. Water is used in industry mainly to
a. cool power plants.
b. keep machinery running.
c. create steam, which is then used for energy.
d. clean huge cooling towers.

Introduction to Water Resources John C. Clausen, 2017-09-29 The study of water resources crosses disciplinary boundaries from geography and natural resources to Earth sciences environmental studies and engineering Since not all students come to the water resources course with the same mathematical background Clausen s effective practical presentation integrates topics related to water quantity and water quality He emphasizes fundamental concepts throughout the qualitative foundations of hydrology needed to understand the hydrologic cycle and water availability as well as the physical chemical and biological principles underlying water quality Important social science issues including water law and regulations the economic principles of water supply and demand and sustainable water management contextualize the material Abundant illustrations and purposeful examples reinforce chapter content End of chapter problems provide opportunities for readers to practice the calculations needed for real world applications

Economics of Water

Resources Mary E. Renwick, 2018-01-18 Water is becoming an increasingly scarce commodity in many parts of the world Population growth plus a growing appetite for larger quantities of cheap water quality as a result of urban industrial and agricultural pollution coupled with increasing environmental demands have further reduced usable suppliers This book brings together thirty of the best economic articles addressing water scarcity issues within the US and Mexico By touching on a number of different issues this volume clearly articulates the need for improving existing institutional arrangements as well as for developing new arrangements to address growing water scarcity problems

Wetlands and Water Resources: Ecological Solutions for the Environment Guangzhi Sun, Xiaofei Yu, Yuanchun Zou, Guobin Fu, 2023-04-12 Wetlands are usually located in complex landscapes Multiple ecosystem services delivered by wetlands to human well being should be considered in broader contexts of wetland functions water quality water resource management and wetland conservation Natural wetlands are kidneys and sponges of the earth that remove water pollutants and provide hydrological regulation functions vital to the environment Where the functions of the wetlands are weakened actions of rehabilitations are needed to revitalize those functions While worldwide many natural wetlands have disappeared due to climate change and or human activities constructed wetlands which may be seen as artificial kidneys sponges of the earth have been increasingly built to replicate the functions of the natural wetlands This Research Topic aims to collect and present the latest research developments in natural and constructed wetlands in relation to either water resource functions or water quality Articles published in this Research Topic will showcase new understandings of water balances and flow patterns vegetation characteristics and pollutant transformations in wetland systems innovative designs and efficiencies of wastewater treatment wetlands and technologies that revitalize the ecosystem functions of natural wetlands These articles are expected to bring benefits to research communities water and wastewater industries and government agencies that deal with wetland water management and conservation High quality Original Research and Review articles in this field are all welcome for submission to this

Research Topic Research interests include but are not limited to the following areas 1 Water balances and flow patterns in natural wetland systems 2 The hydrological regulation functions and importance of natural wetlands in their environmental context 3 Vegetation characteristics of natural wetlands and their functional importance in wetland water pollution control 4 Techniques for the rehabilitation of degraded wetlands 5 The role of constructed wetlands in wastewater treatment 6 Innovative designs and efficiencies of wastewater treatment wetlands 7 The modeling of hydrological and or pollutant dynamics in wetland systems 8 The ecohydrology of wetlands 9 The role of wetlands in the global carbon cycle 10 Impacts of climate change and human activities on wetland hydrology and water resources Recognizing that hydrological and biogeochemical processes are basically coupled in wetlands and their landscapes manuscripts that report their interactions are particularly welcome

becoming an alternative This book briefly describes some key global water challenges perspectives for remote sensing approaches and their importance for water resources related activities It describes eight key types of water resources management variables a list of sensors that can produce such information and a description of existing data products with examples Earth Observation for Water Resources Management provides a series of practical guidelines that can be used by project leaders to decide whether remote sensing may be useful for the problem at hand and suitable data sources to consider if so The book concludes with a review of the literature on reliability statistics of remote sensed estimations

Topics on System Analysis and Integrated Water Resources Management Andrea Castelletti, Rodolfo Soncini-Sessa, 2006-10-19 The Integrated Water Resources Management IWRM paradigm has been worldwide recognized as the only feasible way currently available to ensure a sustainable perspective in planning and managing water resource systems It is the inspiring principle of the Water Framework Directive adopted by the European Union in 2000 as well as the main reference for all the water related activity of UNESCO in the third world countries However very often real world attempts of implementing IWRM fail for the lack of a systematic approach and the inadequacy of tools and techniques adopted to address the intrinsically complex nature of water systems This book explores recent and important contributions of System Analysis and Control Theory to the technical application of such paradigm and to the improvement of its theoretical basis Its prior aim is to demonstrate how the modelling and computational difficulties posed by this paradigm might be significantly reduced by strengthening the efficiency of the solution techniques instead of weakening the integration requirements The first introductory chapter provides the reader with a logical map of the book by formalizing the IWRM paradigm in a nine step decisional procedure and by identifying the points where the contribution of System Analysis and Control Theory is more useful The book is then organized in three sections whose chapters analyze some theoretical and mathematical aspects of these contributions or presents design applications The outstanding research issues on the border between System Analysis and IWRM is depicted in the last chapter where a pull of scientists and experts coordinated by Prof Tony Jakeman describe the foreseeable scenario The book is based on the most outstanding contributions to the IFAC workshop on Modelling and Control for Participatory Planning and Managing Water Systems held in Venice September 28 October 1 2004 That workshop has been conceived and organized with the explicit purpose of producing this book the maximum length of the papers was unusually long of the size of a book chapter and only five long oral presentations were planned each day thus allowing for a very useful and constructive discussion Contributions from the leading world specialists of the field Integration of technical modelling aspects and participatory decision making Good compromise between theory and application
