Lindoy, Ian M. Atkinson, 2000 Molecular self assembly is a widespread phenomenon in both chemistry and biochemistry Yet it was not until the rise of supramolecular chemistry that attention has increasingly been given to the designed self assembly of a variety of synthetic molecules and ions To a large extent success in this area has reflected knowledge gained from nature However an increased awareness of the latent steric and electronic information implanted in individual molecular components has also contributed to this success Whilst not yet approaching the sophistication of biological assemblies synthetic systems of increasing subtlety and considerable aesthetic appeal have been created Self Assembly in Supramolecular Systems surveys highlights of the progress made in the creation of discrete synthetic assemblies and provides a foundation for new workers in the area as well as background reading for experienced supramolecular chemists      **Biology** Vernon L. Boron has all the best tunes That may well be the first impression of the Group 13 elements The chemical literature fosters the impression not only in the primary journals but also in a steady outflow of books focussing more or less closely on boron and its compounds The same preoccupation with boron is apparent in the coverage received by the Group 13 elements in the comprehensive and regularly updated volume of the Gmelin Handbook Yet such an imbalance cannot be explained by any inherent lack of variety interest or consequence in the heavier elements Aluminium is the most abundant metal in the earth's crust in the industrialised world the metal is second only to iron in its usage and its compounds can justifiably be said to touch our lives daily to the potential detriment of those and other lives some would argue From being chemical curios gallium and indium have now gained considerably prominence as sources of compound semiconductors like gallium arsenide and indium antimonide Nor is there any want of incident in the chemistries of the heavier Group 13 elements In their redox coordination and structural properties there is to be found music indeed notable not always for its harmony but invariably for its richness and variety This book seeks to redress the balance with a definitive wide ranging and up to date review of the chemistry of the Group 13 metals aluminium gallium indium and thallium
