## Production Schemes

### 1. Factory in Wichita, Kansas

- a. Write one or two sentences to describe the cost function for the Wichita factory.

*The cost of producing 25,000 units is \$1. From 25,001 units to 35,000 units the cost lowers to \$0.80.*

- b. Write the piecewise function for the cost per unit for production of units in the Wichita factory. That is, state the function  $C(x)$ , where  $x$  is the number of units produced.

$$f(x) = \begin{cases} \$1, & \text{for } 1 \leq x < 25,000 \\ \$0.80, & \text{for } 25,000 < x \leq 35,000 \end{cases}$$

- c. What is the cost per unit for 35,000 units?

$$\text{Cost per unit for 35000 units} = C(35000) = \frac{0.8}{35000} = 2.28(10^{-5})$$

- d. According to the graph, if only one unit was produced, the cost per unit would be \$1.00. In reality, the company would not call in its workers and start up the equipment to produce one unit. What safeguard do you think that many manufacturers use to avoid this type of problem?

*The factory would study the expenses involved with setting the factory into production, wages for workers' salaries, and other factory running expenses into the total cost of producing the units (such would obviously drastically change the graph from the one presented), and make sure that there is a threshold at least on the "breaking even" with the estimated revenue coming from the units produced/ordered.*

- e. Of the following three statements, choose the best option and write a viable argument showing how it is reflected by the Cost Function for Wichita's factory.

*The plant's production processes are performed primarily by robots that are able to work longer hours, when needed, at no additional cost.*
