**A Methodology for the Cryptanalysis of Classical Ciphers with Search Metaheuristics**  
George Lasry, 2018 Cryptography the art and science of creating secret codes and cryptanalysis the art and science of breaking secret codes underwent a similar and parallel course during history Both fields evolved from manual encryption methods and manual codebreaking techniques to cipher machines and codebreaking machines in the first half of the 20th century and finally to computerbased encryption and cryptanalysis from the second half of the 20th century However despite the advent of modern computing technology some of the more challenging classical cipher systems and machines have not yet been successfully cryptanalyzed For others cryptanalytic methods exist but only for special and advantageous cases such as when large amounts of ciphertext are available Starting from the 1990s local search metaheuristics such as hill climbing

genetic algorithms and simulated annealing have been employed and in some cases successfully for the cryptanalysis of several classical ciphers. In most cases however results were mixed and the application of such methods rather limited in their scope and performance. In this work a robust framework and methodology for the cryptanalysis of classical ciphers using local search metaheuristics mainly hill climbing and simulated annealing is described. In an extensive set of case studies conducted as part of this research this new methodology has been validated and demonstrated as highly effective for the cryptanalysis of several challenging cipher systems and machines which could not be effectively cryptanalyzed before and with drastic improvements compared to previously published methods. This work also led to the decipherment of original encrypted messages from WWI and to the solution for the first time of several public cryptographic challenges.

**Artificial Intelligence & Games** Georgi Togeli, 2024-09-03. As has been pointed out by several industrial game AI developers the lack of behavioral modularity across games and in game tasks is detrimental for the development of high quality AI. An increasingly popular method for ad hoc behavior authoring that eliminates the modularity limitations of FSMs and BTs is the utility based AI approach which can be used for the design of control and decision making systems in games. Following this approach instances in the game get assigned a particular utility function that gives a value for the importance of the particular instance. For instance the importance of an enemy being present at a particular distance or the importance of an agent's health being low in this particular context. Given the set of all utilities available to an agent and all the options it has utility based AI decides which is the most important option it should consider at this moment. The utility based approach is grounded in the utility theory of economics and is based on utility function design. The approach is similar to the design of membership functions in a fuzzy set. A utility can measure anything from observable objective data e.g. enemy health to subjective notions such as emotions, mood and threat. The various utilities about possible actions or decisions can be aggregated into linear or non linear formulas and guide the agent to take decisions based on the aggregated utility. The utility values can be checked every n frames of the game. So while FSMs and BTs would examine one decision at a time utility based AI architectures

Chemical Elements in Plants and Soil: Parameters Controlling Essentiality Stefan Fränze,2009-12-18 Earlier works on plant essential elements have revealed a series of complicated counter intuitive relationships among various chemical elements in different plant species due to both unlike usage of certain elements in plants and to different carriers effecting resorption and transport In an attempt to provide a more coherent theory behind plant mineral nutrition this groundbreaking book adopts a very different approach from the existing literature presenting an

explanation of the essentiality of chemical elements in biological systems and the application of stoichiometric network analysis SNA to the biological system of elements Starting with data from biochemical environmental analysis and a discussion of the phenomena involved in metal ion partition and autocatalytic behaviour conditions and criteria controlling the partition of metals into biomass are investigated Several rules are derived and investigated in terms of their interaction both in comparisons among contemporary organisms and in terms of evolution This allows the construction for example of a map which directly traces the biological feature of essentiality to parameters of coordination chemistry The book will have worldwide appeal for researchers interested in fields such as soil plant interactions bioinorganic chemistry plant nutrition phytomining bioremediation biogeochemistry nutrient cycling soil chemistry and cellular physiology
