Modelling and Analysis of Fine Sediment Transport in Wave-Current Bottom Boundary Layer Liqin Zuo, 2018-06-19 The evolution and utilization of estuarine and coastal regions are greatly restricted by sediment problems This thesis aims to better understand fine sediment transport under combined action of waves and currents especially in the wave current bottom boundary layer BBL Field observations experimental data analysis theoretical analysis and numerical models are employed Silt dominated sediments are sensitive to flow dynamics and the suspended sediment concentration SSC increase rapidly under strong flow dynamics This research unveils several fundamental aspects of silty sediment i e the criterion of the incipient motion the SSC profiles and their phase averaged parameterization in wave dominated conditions An expression for sediment incipient motion is proposed for silt sand sediment under combined wave

and current conditions A process based intra wave 1DV model for flow sediment dynamics near the bed is developed in combined wave current conditions The high concentration layer HCL was simulated and sensitivity analysis was carried out by the 1DV model on factors that impact the SSC in the HCL Finally based on the 1DV model the formulations of the mean SSC profile of silt sand sediments in wave conditions were proposed The developed approaches are expected to be applied in engineering practice and further simulation
