

Nuclear Fission & Fusion Worksheet Answers

1) Explain the process of nuclear fission.

Heavy nuclei, such as those in uranium, are often unstable and may undergo nuclear fission, a process where the nucleus randomly splits into two smaller nuclei (sometimes referred to as 'daughter nuclei'). This fission can occur spontaneously or can be induced by external factors. During nuclear fission, a large amount of energy is released along with several free neutrons, in addition to the two smaller nuclei.

2) Explain, with the use of a diagram, an example of an induced nuclear fission. Include the steps involved in the nuclear fission.

Nuclear fission is depicted in the simple diagram as follows:

A neutron is approaching the nucleus of a U-235 atom.

The neutron is absorbed by the nucleus, temporarily transforming it into an excited U-236 atom.

The U-236 atom undergoes fission, splitting into two smaller nuclei (Ba-141 and Kr-92) and releasing three additional neutrons, along with a substantial amount of energy.

3) Explain why nuclear fission releases energy.

Nuclear fission releases energy because the resulting smaller nuclei have a greater binding energy per nucleon compared to the original, larger nucleus.

The book begins with the very basic building blocks of science breaking down the different types of energy and how we use them, the materials that make up an atom and our search for the perfect renewable energy source. Set against the cultural backdrop of World War II, later chapters follow each significant theory that led to the creation of the world's most dangerous weapon as well as some of its most widely used medical and food production processes today. Nuclear Fission Robert Vandenbosch, 2012-12-02 Nuclear Fission provides a comprehensive account of nuclear fission. This book is organized into 14 chapters. Chapter I introduces and discusses the discovery of fission followed by a treatment of transition nucleus in Chapters II to VIII. Chapter IX deals with the theories of mass and energy distributions. The kinetic energy release in fission is described in Chapter X while the distribution of mass and charge in fission is considered in Chapter XI. Chapters XII and XIII consider the emission of neutrons and rays from fission. Detailed studies of the particles accompanying fission are covered in the last chapter. This volume is intended for students but is also valuable to research scientists interested in the physics and chemistry of fission. *Fission and Fusion* Lifeliqe, 2019 This lesson plan covers nuclear fission and nuclear fusion. **Energy From The Nucleus: The Science And Engineering Of Fission And Fusion** Gerard M Crawley, 2016-08-11 Nuclear energy is important both as a very large energy resource and as a source of carbon free energy. However incidents such as the Fukushima Daiichi nuclear disaster 2011, the Chernobyl disaster 1986 and the Three Mile Island accident 1979 have cast doubts on the future of nuclear fission as a major player in the future energy mix. This volume provides an excellent overview of the current situation regarding nuclear fission as well as a description of the enormous potential advantages offered by nuclear fusion including an essentially unlimited fuel supply with minimal environmental impact. *Energy from the Nucleus* focuses on the two main approaches to producing energy from the nucleus: fission and fusion. The chapters on nuclear fission cover the status of current and future generations of reactors as well as new safety requirements and the environmental impact of electricity production from nuclear fission. The chapters on nuclear fusion discuss both inertial confinement fusion and magnetic confinement fusion including the new international fusion test facility ITER. The expertise of the authors who are active participants in the respective technologies ensures that the information provided is both reliable and current. Their views will no doubt enlighten our understanding of the future of energy from the nucleus. *Fission, Fusion and the Energy Crisis* Stanley Ernest Hunt, 1974 **Chemistry** William L.

Masterton, Emil J. Slowinski, Edward Walford, 1980 Covers the principles basic to a beginning course in chemistry developed in considerable detail from an elementary point of view Includes a large number of questions and problems graded in difficulty with answers in appendixes after text at the end of each chapter as well as a large number of solved examples about 200 the solutions emphasize reasoning rather than which number goes where

The Curve of Binding Energy Paul F. Kisak, 2016-05-31 Nuclear binding energy is the energy that would be required to disassemble the nucleus of an atom into its component parts These component parts are neutrons and protons which are collectively called nucleons The binding energy of nuclei is due to the attractive forces that hold these nucleons together and this is usually a positive number since most nuclei would require the expenditure of energy to separate them into individual protons and neutrons The mass of an atomic nucleus is usually less than the sum of the individual masses of the constituent protons and neutrons according to Einstein's equation $E = mc^2$ and this missing mass is known as the mass defect and represents the energy that was released when the nucleus was formed The term nuclear binding energy may also refer to the energy balance in processes in which the nucleus splits into fragments composed of more than one nucleon If new binding energy is available when light nuclei fuse or when heavy nuclei split either process can result in release of this binding energy This energy may be made available as nuclear energy and can be used to produce electricity as in nuclear power or in a nuclear weapon When a large nucleus splits into pieces excess energy is emitted as photons gamma rays and as the kinetic energy of a number of different ejected particles nuclear fission products The nuclear binding energies and forces are on the order of a million times greater than the electron binding energies of light atoms like hydrogen The mass defect of a nucleus represents the mass of the energy of binding of the nucleus and is the difference between the mass of a nucleus and the sum of the masses of the nucleons of which it is composed
