

Fencing in Red Hat Enterprise Linux: Methods, Use Cases, and Failover

Author Name: Shane Bradley and Allison Pranger

OVERVIEW

The instability or failure of one node in a cluster can severely impact the other interconnected nodes. To prevent data damage or loss across the cluster, Red Hat requires the use of fencing in all clustered environments.

Fencing is the disconnection of a node from a cluster's shared storage. This cuts off I/O from shared storage, which ensures data integrity, and can remove a node from the cluster.

This document provides a brief overview of fencing methods, describes how to manually call fence agents from the command line, outlines fencing use cases, and lists steps to test failover.

Environment

- Red Hat Enterprise Linux 5 Advanced Platform
- Red Hat Enterprise Linux 6 (High Availability and Resilient Storage Add-Ons)

FENCING METHODS

Red Hat supports a variety of fencing methods, including network-power fencing, network-switch fencing, virtual-machine fencing, and storage fencing. You can configure a node with one fencing method or multiple fencing methods. When you configure a node for one fencing method, that is the only fencing method available for fencing that node. When you configure a node for multiple fencing methods, the fencing methods are cascaded from one fencing method to another, according to the order of the fencing methods specified in the cluster configuration file, until a node is successfully fenced.

For a general overview of fencing and supported fencing types, see the official product documentation at http://docs.redhat.com/docs/en-US/Red_Hat_Enterprise_Linux/5/html/High_Availability_Add-On_Overview/ch-fencing.html.

SCSI Persistent Reservations

If your storage devices support the use of SCSI persistent reservations, Red Hat will support SCSI persistent reservations as a fencing method through the use of the **fence_scsi** agent. However, you should note that SCSI reservations differ significantly from traditional methods such as network-power, network-switch, and virtual-machine fencing (for more information about SCSI persistent reservations, see the tech brief at <https://access.redhat.com/knowledge/technists/how-control-access-shared-storage-devices-using-scsi-persistent-reservations-ns>).
