

Regulating the Cell Cycle

Abstract: In this paper, we study the asymptotic behavior of the spectral gap of the Laplacian on a graph with a fixed number of vertices and a fixed number of edges. We show that the spectral gap is bounded below by a constant depending only on the number of vertices and edges.

When the study's ethics board at the University of Minnesota gave its final approval, we briefly contacted the participants' supervising faculty to give them some advance notice. We then sent them a letter explaining the procedures and giving them a choice of whether they wanted to be involved. The researchers had no role in whether anyone participated. We also assured participants that their involvement was completely voluntary and that they could withdraw at any time without any negative consequences.

Cell Cycle Regulation Robert R. Ruffolo, Jr., George Poste, Brian W. Metcalf, 1997-12-23 Focuses on recent key discoveries made relating to the cell cycle and its regulation a critical new horizon in therapeutics Research into all aspects of cell cycle regulation has undergone explosive growth during the past decade due to the powerful techniques of molecular biology An overall view of the cellular processes both at the enzymatic and genetic level has been identified in continually finer detail as described inside this text This has enabled significant progress in the identification of drugs capable of acting on specific components of the cell cycle with the result that we may soon have the ability to manipulate the cell cycle pharmacologically The potential impact on clinical conditions such as cancer hematopoiesis angiogenesis inflammation organ remodelling and apoptosis is vast Originating from presentations at the Eighth SmithKline Beecham Pharmaceuticals United States Research Symposium each chapter in this volume is written by an opinion leader in the field

Accompany the Science of Genetics Alan G. Atherly, 1999-11 **Systems Biology of Transcription Regulation** Ekaterina Shelest, Edgar Wingender, Joerg Linde, 2016-09-09 Transcription regulation is a complex process that can be considered and investigated from different perspectives Traditionally and due to technical reasons including the evolution of our understanding of the underlying processes the main focus of the research was made on the regulation of expression through transcription factors TFs the proteins directly binding to DNA On the other hand intensive research is going on in the field of chromatin structure remodeling and its involvement in the regulation Whatever direction we select we can speak about several levels of regulation For instance concentrating on TFs we should consider multiple regulatory layers starting with signaling pathways and ending up with the TF binding sites in the promoters and other regulatory regions However it is obvious that the TF regulation also including the upstream processes represents a modest portion of all processes leading to gene expression For more comprehensive description of the gene regulation we need a systematic and holistic view which brings us to the importance of systems biology approaches Advances in methodology especially in high throughput methods result in an ever growing mass of data which in many cases is still waiting for appropriate consideration Moreover the accumulation of data is going faster than the development of algorithms for their systematic evaluation Data and methods integration is indispensable for the acquiring a systematic as well as a systemic view In addition to the huge amount of molecular or genetic components of a biological system the even larger number of their interactions constitutes the enormous complexity of processes occurring in a living cell organ organism In systems biology these interactions are represented by networks Transcriptional or more generally gene regulatory networks are being generated from experimental

ChIPseq data by reverse engineering from transcriptomics data or from computational predictions of transcription factor TF target gene relations While transcriptional networks are now available for many biological systems mathematical models to simulate their dynamic behavior have been successfully developed for metabolic and to some extent for signaling networks but relatively rarely for gene regulatory networks Systems biology approaches provide new perspectives that raise new questions Some of them address methodological problems others arise from the newly obtained understanding of the data These open questions and problems are also a subject of this Research Topic
