Abstract—The purpose of this study was to determine if there were differences in the prevalence of musculoskeletal disorders among different types of workers. The study included 600 male employees from three companies. Data were collected by means of a questionnaire that asked about symptoms of musculoskeletal disorders, work conditions, and demographic characteristics. Results showed that the prevalence of musculoskeletal disorders was higher among non-manual workers than manual workers. This result may be due to the fact that non-manual workers had more exposure to risk factors such as prolonged sitting, repetitive movements, and awkward postures.
