### **Disciplinary Intuitions and the Design of Learning**

**Environments** Kenneth Y. T. Lim,2014-10-19 As children we would have spilt glasses of milk dropped things and broken things As children therefore we would have developed intuitions about how the world works but we would not necessarily have been able to explain these workings It would only have been till we entered formal schooling that we would have learned codifications of canon within each respective discipline and consequently how to articulate the canon to explain the intuition The preceding example was from the natural sciences but one could just have easily taken an example from say the environmental sciences or from the social sciences Indeed much of this book does just that as it seeks to chart the territory of a new theory of learning around Disciplinary Intuitions Many of the chapters within draw frequent and explicit linkages to curriculum design from the premise of the need to go beyond addressing the conceptions of learners to seeking to understand the substrate upon which these conceptions are founded The argument is made that this substrate comprises the particular set of lived experiences of each learner and how because these lived experiences are as tacit as they are diverse designing curriculum around misconceptions and preconceptions alone would not lead to enduring understanding from first principles From this perspective Disciplinary Intuitions constitute an exciting field at the nexus of learning theories and curriculum design

Rudimentary Treatise on Mensuration and Measuring, for Students and Practical Use Thomas Baker,1878 **For All Practical Purposes** Consortium for Mathematics and Its Applications (U.S.),2006 For All Practical Purposes is the most effective and engaging textbook available for showing mathematics at work in areas with a direct impact on our lives consumer products and advertising politics the economy the Internet It was the first and remains the best textbook for liberal arts students and for instructors who want to bring students the excitement of contemporary mathematical thinking and help their students think logically and critically The new edition offers a number of changes designed to make the text more accessible than ever to a wider range of students and instructors Symmetry, Causality, Mind Michael Leyton,1992 In this investigation of the psychological relationship between shape and time Leyton argues compellingly that shape is used by the

mind to recover the past and as such it forms a basis for memory Michael Leyton's arguments about the nature of perception and cognition are fascinating, exciting, and sure to be controversial. In this investigation of the psychological relationship between shape and time, Leyton argues compellingly that shape is used by the mind to recover the past and as such it forms a basis for memory. He elaborates a system of rules by which the conversion to memory takes place and presents a number of detailed case studies in perception, linguistics, art, and even political subjugation that support these rules. Leyton observes that the mind assigns to any shape a causal history explaining how the shape was formed. We cannot help but perceive a deformed can as a dented can. Moreover, by reducing the study of shape to the study of symmetry, he shows that symmetry is crucial to our everyday cognitive processing. Symmetry is the means by which shape is converted into memory. Perception is usually regarded as the recovery of the spatial layout of the environment. Leyton, however, shows that perception is fundamentally the extraction of time from shape. In doing so, he is able to reduce the several areas of computational vision purely to symmetry principles. Examining grammar in linguistics, he argues that a sentence is psychologically represented as a piece of causal history, an archeological relic disinterred by the listener so that the sentence reveals the past. Again, through a detailed analysis of art, he shows that what the viewer takes to be the experience of a painting is in fact the extraction of time from the shapes of the painting. Finally, he highlights crucial aspects of the mind's attempt to recover time in examples of political subjugation.
