## FAQs:

### Can everyone have a vaccine?

Most vaccines are suitable for everyone. Some vaccines may not be suitable for use with children or people who have a health condition or treatment that impairs the function of their immune system. If an individual is poorly or has a fever, then their vaccination may be postponed until they are better.

### What is a booster vaccine and why do we need it?

For some vaccines a further round of exposure to the vaccine is required to increase (or 'boost') immunity against the disease. Immunity against some diseases can fade over time and it is important to keep up to date with booster vaccines to ensure as good protection as possible.

One example of routine childhood vaccinations is MMR vaccine. The first dose is given at the age of **12 months** and the second dose is given at around three years and four months, before starting school. Having both doses gives long lasting protection against measles, mumps and rubella.

### How long does it take to develop a vaccine?

Normally it can take around 10 years or more for a vaccine to be developed. In the case of COVID-19 this has been much quicker as scientists from around the world had made major advances in vaccine development over recent years and shared information based on existing research into other Coronaviruses. Extra funding was also made available and vaccine manufacture began at the same time that the vaccine was being tested in people – called the 'trial phase'.

**Pediatric Infectious Diseases Revisited** Stefan Wirth, 2007-08-08 The fifth volume of *Birkhäuser Advances in Infectious Diseases* is focused on pediatric infectious diseases. In modern medicine, the discipline pediatric infectious diseases is an important medical specialty. The successful prevention of childhood diseases like diphtheria, tetanus and pertussis has made a major contribution to the improvement of public health. Understanding the biology of causative agents and the pathogenesis is an essential step in achieving control and elimination of disease. Today pediatric infectious diseases research is closely interconnected with other disciplines. This volume addresses vaccination, historical, epidemiological and socio-cultural issues as well as clinical and molecular biological aspects of pediatric infectious diseases. New insights into the pathogenesis of infection are presented and an update on diagnostics, prevention and treatment of pediatric bacterial, viral, fungal and parasitic diseases is provided. The role of emerging new pathogens is also pointed out. Finally, the future perspectives of pediatric infectious diseases are highlighted. Therefore, this book aims at an interdisciplinary audience of clinicians and non-clinicians, pediatricians, infectious disease researchers, virologists, microbiologists as well as public health scientists and politicians. We would like to sincerely thank the staff of Birkhäuser publishers and notably Dr Beatrice Menz for editing this volume of the *Advances in Infectious Diseases* series. Most of all, we would like to thank all our colleagues who are international experts and scientists in their respective field and who generously shared their knowledge in the broad interdisciplinary area of pediatric infectious diseases with us.
