OBJECTIVES:

- Adequate nutrition is essential to maintain normal physiologic functions
- Enteral feeding also helps maintain an important immunological barrier
- 30-50% of ICU pts are malnourished, malnutrition associated w/ [poor outcomes](#)

WHEN TO START ENTERAL FEEDS?

- Early enteral nutrition (>48 hrs after onset of critical illness) is associated with **reduced mortality and reduced incidence of infections** (particularly pneumonia).
- Deliberate underfeeding is not associated with improved outcomes ([PERMIT 2019](#))
- No survival advantage with early parenteral nutrition ([EPN 2021](#))
- Enteral nutrition can be safely given while in the [prone position](#) or [receiving ECMO](#).
- EN can also be given [while on neurovascular blockers](#) or [while on ECMO](#).

WHEN NOT TO START ENTERAL FEEDS?

- Early EN may be poorly tolerated in patients in shock ([OUTRILLA 21](#)); however the only absolute contraindications to initiating enteral nutrition (EN) are bowel obstruction, perforation, mesenteric ischemia, or major GI bleeding.

ENTERIC FEED FORMULA:

- [Formulas](#) contain a mixture of macronutrients (carbohydrates, lipids, & protein) as well as micronutrients (electrolytes, vitamins, & trace elements). Select based upon clinical context.

- Despite theoretical basis, there is little clinical evidence for many novel disease specific formula (ARDS, COPD, liver).

- There is also limited evidence for additives like glutamine, etc

Carbohydrate	Lipids	Protein	
4.0 kcal/g	9 kcal/g	4.0 kcal/g	Energy content
0.7 U/g	1.4 U/g	0.8 U/g	O ₂ produced
0.9 - 1.0	0.7	0.8	Respiratory quotient

Formula Type	Examples
Standard (2 kcal/mL) – similar to typical US diet in terms of calorie density , used in most ICU patients <div> <div>50-60%</div> <div>25-40%</div> <div>20-30%</div> </div>	Ensure, Isosource, Boost, Omnilite
Concentrated (3.5-2.0 kcal/mL) – same contents, less volume, useful in patients on fluid restriction <div> <div>50-60%</div> <div>25-40%</div> <div>20-30%</div> </div>	Ensure plus, Impact 1.5, Trocal HN, Nutren, Renal, Nutren 2.0
High protein – useful for patients with high protein needs (>1.5 g/kg/day) <div> <div>45-55%</div> <div>20-30%</div> <div><20%</div> </div>	Isosource HN, Omnilite HN, Replete, Boost HP, Peptamen VHP, Ensure HP, Promote
Pre-digested (2.5 kcal/mL) – Low lipid content, partially digested/easily absorbed peptides, used in malabsorption <div> <div>>60%</div> <div><10%</div> <div>30%</div> </div>	Peptamen, Vionate PLOS, Vivonex TEN, Atilaq
High fiber – contains soluble & insoluble fiber, used when there is persistent diarrhea on other feeds <div> <div>50-60%</div> <div>25-40%</div> <div>20-30%</div> </div>	Jevity, Ensure with fiber, Promote with fiber, Nutren 1.0 fiber, Compleat, Ultracal
Renal – Concentrated (3.5-2.0 kcal/mL), low K ⁺ & PO ₄ , low protein, used for people with renal failure <div> <div>60-80%</div> <div>20-40%</div> <div><20%</div> </div>	Nepro, Magnacal Renal, Suplena, Novasource Renal, Renacal

CALCULATING CALORIC NEEDS:

- Energy expenditure depends on mass, metabolism, & illness.
- It is not necessary to meet full caloric needs; many benefits of early feeding are realized with any EN. Paradoxically, achieving 100% of caloric needs in the 1st week [may be harmful](#). Thus, while early feeding is preferable the goal need not be full calories.

- Simple formula to estimate basal energy expenditure (BEE)

$$BEE \text{ kcal/day} = 25 \times \text{weight (kg)}$$

For most people use actual weight. If volume overloaded, use dry weight. If obese (BMI > 30 kg/m²) use 110% of BW.

- Disease can modify caloric needs:

- Fever 10% more calories per degree C
- Peritonitis 30-50% more, Sepsis 40-60% more
- Trauma: 20-60% more Burns: >50-100% depends on BSA

- Higher protein may be beneficial in select population ([TARGET 2018](#))

Most critically ill patients require 1.2-1.5 g/kg/day of protein

- Patient with burns may require high protein 3 g/kg/day (add supplements if needed)

- Consider branched chain amino acids (BCAA) in patients with [hepatic encephalopathy](#)

- Indirect calorimetry measures VCO₂ & VO₂ to calculate EE

$$EE \text{ kcal/day} = 1440 \times [(3.94 \times V\dot{O}_2) + (1.11 \times V\dot{CO}_2)]$$

- Only possible to obtain accurate measurements if FIO₂ is < 0.6

- Respiratory quotient [can identify problems](#) or fine-tune feeding:

- RQ >1 suggests overfeeding → decrease carbs or lipids
- RQ <0.8 suggest underfeeding → increase calories

Indirect calorimetry results in [more calories & protein administered](#)

Use a [calculator](#) to determine the rates of a particular enteral feed.

RESIDUALS:

- Residuals** are contents that remain in the stomach, after tube feeding is paused.
- At least 500ml of residuals can be safely tolerated without intervention ([MAGNUS 2019](#))
- If TF are poorly tolerated (residuals >500, vomiting, gastric distension), consider the following:
 - Maintain head up >30 degrees (good practice to prevent VAP)
 - Administer pro-kinetic agents (erythromycin is superior to metoclopramide)
 - Consider advancing FT post-pyloric or into jejunum (especially if vomiting)
- Increasingly, there is evidence for NOT checking residuals at all (less RN work, no improvement in outcomes)

FEEDING TUBES (FT):

Nasal can be used in intubated or non-intubated patients but there is a [higher risk of sinusitis](#) among people who are intubated.

Gastric – used for bolus or continuous feeds

Post-pyloric & jejunal can be used only for continuous feeds.

Post-pyloric (duodenal) – small

Decrease in pneumonia risk; used in patients w/ gastric outlet obstruction, vomiting.

Jejunal – used in specific patients (vomiting, intolerance), O₂/N₂ not superior O₂/N₂ ([BENNETT 2014](#))

Consider permanent gastric tube in people who require FT for >4-6 weeks

[Similar outcomes](#) with intermittent & continuous tube feeds. Can use either.

Gastric 16-18in

Post-pyloric 12in (via duodenal)

Jejunal 14-18in

Pediatric Hepatology and Liver Transplantation Lorenzo D'Antiga, 2019-04-29 This book is the first to provide a balanced examination of both pediatric liver disease and liver transplantation, two topics that are inherently related, given that most chronic liver disorders eventually require organ replacement. The different forms of liver disease encountered in the pediatric age group are first discussed in a series of disease-specific chapters that have a reader-friendly uniform structure covering pathophysiology, diagnostic and treatment algorithms, clinical cases and transition to adult care. Key topics in the field of liver transplantation are then addressed. Examples include indications and contraindications, surgical techniques and complications, immunosuppression in pediatric liver transplantation, acute and chronic rejection and allograft dysfunction, and CMV and EBV infection in transplant recipients, long-term graft injury and tolerance. A section on pediatric hepatology across the world includes chapters presenting the features and management of pediatric liver disease in South America, Africa and Asia. A closing section considers what the future holds for pediatric liver disease and its management, including novel genetic testing, cell therapy and gene therapy. *Pediatric Hepatology and Liver Transplantation* will be of value for a range of practitioners, from residents making their first approach to pediatric liver disease through to specialists working in transplantation centers.
