**Optimization of Linear Control Systems** F A Aliev,V B Larin,1998-11-19 The authors present analytical methods for synthesis of linear stationary and periodical optimal controlled systems and create effective computational algorithms for synthesis of optimal regulators and filters The procedures of Youla Jabr Bongiorno 1976 and Desoer Lin Murray Saeks 1980 are special cases of this procedure The monograph also includes original computational algorithms solutions of usual and generalized Lyapunov and Riccati equations polynomial matrix factorization and illustrates the effectiveness of these algorithms by examples in the field of numerical methods for optimization of linear controlled systems **Linear Time Varying Systems and Sampled-data Systems** Akira Ichikawa,Hitoshi Katayama,2001-02-26 This monograph considers linear optimal regulators differential games and develops the theory for time varying systems and jump systems

**Nonlinear Singular Perturbation Phenomena** K. W. Chang,F. A. Howes,2012-12-06 Our purpose in writing this monograph is twofold On the one hand we want to collect in one place many of the recent results on the existence and asymptotic behavior of solutions of certain classes of singularly perturbed nonlinear boundary value problems On the other we hope to raise along the way a number of questions for further study mostly questions we ourselves are unable to answer The presentation involves a study of both scalar and vector boundary value problems for ordinary differential equations by means of the consistent use of differential inequality techniques Our results for scalar boundary value problems obeying some type of maximum principle are fairly complete however we have been unable to treat under any circumstances problems involving resonant behavior The linear theory for such problems is incredibly complicated already and at the present time there appears to be little hope for any kind of general nonlinear theory Our results for vector boundary value problems even those admitting higher dimensional maximum principles in the form of invariant regions are also far from complete We offer them with some trepidation in the hope that they may stimulate further work in this challenging and important area of differential equations The research summarized here has been made possible by the support over the years of the National Science Foundation and the National Science and Engineering Research Council **Mathematical Methods in Physics, Engineering, and Chemistry** Brett Borden,James Luscombe,2019-11-12 A concise and up to date introduction to mathematical methods for students in the physical sciences Mathematical Methods in Physics Engineering and Chemistry offers an introduction to the most important methods of theoretical physics Written by two physics professors with years of experience the text puts the focus on the essential math topics that the majority of physical science students

require in the course of their studies This concise text also contains worked examples that clearly illustrate the mathematical concepts presented and shows how they apply to physical problems This targeted text covers a range of topics including linear algebra partial differential equations power series Sturm Liouville theory Fourier series special functions complex analysis the Green's function method integral equations and tensor analysis This important text Provides a streamlined approach to the subject by putting the focus on the mathematical topics that physical science students really need Offers a text that is different from the often found definition theorem proof scheme Includes more than 150 worked examples that help with an understanding of the problems presented Presents a guide with more than 200 exercises with different degrees of difficulty Written for advanced undergraduate and graduate students of physics materials science and engineering
