

2.1: MOTION

Motion is the action of changing location or position.

2.1.1: ARISTOTELIAN MOTION

Two types of motion:

1. Natural motion

- also called **vertical motion**
- is the natural tendency of an object to go its natural state
- Heavy things fall and very light materials rise.

Examples: falling of the boulders towards the ground and the rising of smoke up in the air

2. Violent motion

- is the result of removing an object from its natural place
- any motion that required a force to maintain **horizontal motion**. When the force is removed, motion stops.

Examples: pulling of a wagon by a horse and the lifting of a box from the ground by a man

But suppose an object is thrown at an angle. What pushes the rock after it was thrown?

When an object is thrown at an angle, it follows a curved path. An object following a curved path is known as **Projectile**.

In order to explain this, Aristotle came up with the idea of **Antiperistalsis**, which explains that, as an object moves after being thrown through the air, it leaves a vacuum behind it. Since nature abhors vacuum, the air behind the object rushes in violently to fill the space vacated. The force of the rushing air causes the object to be pushed forward.

2.1.2: GALILEAN MOTION

Vertical Motion: In the absence of a resistance, objects would fall with uniform acceleration, not depending on their weight, but in the time of fall.

Example: without any resistance, a 1-kg object will be as fast as a 10-kg object when falling because they fall with the same amount of time, given that they are released from the same height.

Horizontal Motion:

- An object in motion, if unimpeded, will continue to be in motion, and an external force is not necessary to maintain the motion.
- Object tends to slow down or stop because of **friction**—a force that opposes the motion of an object.

Example: if a ball is pushed on an infinitely flat plane, the ball will continue to roll if unimpeded.

Projectile Motion:

Galileo performed experiments on uniformly accelerated motion using an inclined plane, and used the same apparatus to study projectile motion. He believed that a projectile is a combination of uniform motion in the horizontal direction and uniformly accelerated motion in the vertical direction. If it is not impeded, it will continue to move even without an applied force.

Example: when you shoot a ball in a basketball ring, the ball does not need a force to keep it moving.

UNIFORM MOTION

An object is said to be in uniform motion when it is moving with constant velocity with zero acceleration.

Example: Suppose a marble is placed on a leveled smooth surface, the marble will stay at rest without the applied force. If it will be pushed to the left, it will travel left at seemingly uniform rate. And if it will be pushed at right, it will travel right at seemingly uniform rate.

The motion of the marble which is in uniform motion can be presented using line graphs:
