Infant Nutrition B. A. Rolls, Ann Walker, 2013-11-11 Few people doubt that the mother's milk provides the best food for the full term infant during the first few months of life when the digestive absorptive and excretory systems are relatively immature The development of the digestive enzymes is detailed in Chapter 4 The significance of this immaturity first emerged as a consequence of the pioneering work of Professor Robert McCance and Dr Elsie Widdowson in human nutrition when they studied the electrolyte and nitrogen excretion of babies and young animals To quote Professor McCance Inefficient though the kidneys were by adult standards they were capable of maintaining homeostasis provided the infant and animals were growing while being fed on food of exactly the right composition that is the milk of the mother Ashwell 1993 One should not forget that although the mother protects the developing baby against much nutritional abuse the baby may be still be affected by maternal nutrition and this is discussed in Chapter 2 The superior qualities of breast milk are still recognized and research continues to discover yet more factors in breast milk significant to the health of the baby for possible inclusion in formulas The immature stage of development of the baby means that while enough nutrients for optimal growth of all tissues are required excessive quantities may cause intoxication Tight specifications are essential since unlike the adult the newborn depends on a single food
