

to occur in this area, a person might lose their ability to perform math tasks, as well as lose the ability to visualize conceptually and literally.

The medulla oblongata is located on the bottom half of the brain stem. The brain stem is the part of the brain, which connects the main part of the brain mass to the spinal cord serving as the connection between the nervous system and the rest of the body. The medulla oblongata is sometimes termed "little brain" due to its high importance to physiological functioning. This is an extremely vital part of the brain because it controls all the physiological responses and conditions that we are unaware of such as blood pressure, heart rate, oxygen consumption, etc. Due to this fact, if any damage is done to this area, these physiological processes would become compromised and a person's life would be in immediate danger. Death would eventually follow if the damage were unable to be repaired (Johnson, 2009).

Damage to different parts of the brain results in different types of effects. The aspects of how this damage affects processing are still not completely known. Brain scans are useful in helping to determine which part of the brain is affected such as through blood flow, dyes, etc. By understanding how the brain works and is wired, medical practitioners and neurologists can find better ways of treating damage to the brain once it's done and developing surgical ways of correcting the damage.
