

# CHAPTER #9 CONTINUED

## Neurons

process electrical excitability (the ability to respond to a stimulus + convert it into an action potential)

any change in the environment that is strong enough to initiate

initiates an electrical signal that travels along the surface of the membrane of a neurite (nerve fiber)

### Parts of a Neuron

**axon** - conducts nerve impulses toward another neuron, muscle, cell or gland cell

**dendrites** - receiving or input parts of a neuron

**cell body** or **soma**, contains nucleus surrounded by cytoplasm that includes typical organelles

**axon hillock** - thick base of cell body

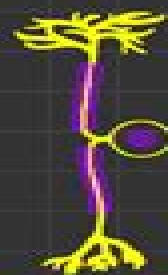

**ganglion** - collection of neuron cell bodies

**nucleus** - clusters of cell bodies found in CNS

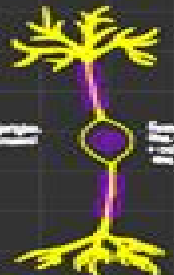

**nerve** - bundles of axons

### Classification of Neurons

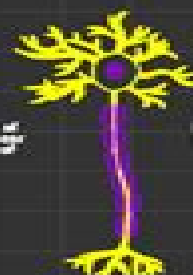

classified according to the number of processes extending from cell body

**Unipolar Neuron**  
few dendrites + one axon  
found in PNS  
dendrites + axon both extend from cell body

**Bipolar Neuron**  
one main dendrite + one axon

**Multipolar Neuron**  
usually have several dendrites + one axon

### Functional Classifications

classified according to the direction in which the nerve impulse (action potential) travels with respect to the CNS

**Sensory (afferent) neurons** - either contain sensory receptors at their distal ends (dendrites) or are located just after sensory receptors that are separate cells

Sensory neuron forms an action potential in its axon + the action potential is conveyed into the CNS through cranial or spinal nerves, superior to dendrites

**Motor (efferent) neurons** - convey action potentials away from the CNS to effectors (muscles + glands) in the PNS through cranial or spinal nerves from multipolar in CNS

**Interneurons (association) neurons** - located within CNS between sensory + motor neurons. Process incoming sensory info + direct motor response
