It is important to note that the results of this study are based on a single cross-sectional survey and may not be generalizable to other populations or settings. Future research should aim to replicate these findings in larger, more diverse samples and explore the underlying mechanisms of the observed associations.

Photosynthesis Robert M. Devlin, Allen V. Barker, 1971 Photosynthesis R.P. Gregory, 2012-12-06 Photosynthesis the capture of light energy by living organisms is a simple enough concept but its investigation draws on the resources of disciplines from all fields of science The aim of this text is to provide a clear stimulating and essentially affordable coverage for undergraduate students of biology The activity of science is debate and practical experiment its product is a body of propositions which at any given time reflects the judgment and prejudices of those taking part The value of a proposition is related to the conceivable alternatives and writing it down without its context creates the false impression that science progresses by compilation of an increasing list of absolute truths It does not the facts and figures presented in the following pages have no intrinsic value unless they can be used by the reader to support an argument or point of view In short the reader is urged to respond So what to every item Secondly ideas like other foods should be date stamped science is inseparable from its history I have set out time charts to represent the evolution of our understanding in certain areas I have assumed that the reader is pursuing a course with a content of biochemistry microbiology and plant science or has access to basic texts I have assumed also that common methods such as spectrophotometry chromatography and electrophoresis as well as the techniques of molecular biology will be either part of the same course or in active use nearby

Mohanty,Govindjee,2012-12-06 All biomass is derived from photosynthesis This provides us with food fuel as well as fibre This process involves conversion of solar energy via photochemical reactions into chemical energy In plants and cyanobacteria carbon dioxide and water are converted into carbohydrates and oxygen It is the best studied research area of plant biology We expect that this area will assume much greater importance in the future in view of the depleting resources of the Earth s fuel supply Furthermore we

believe that the next large increase in plant productivity will come from applications of the newer findings about photosynthetic process especially through manipulation by genetic engineering The current book covers an integrated range of subjects within the general field of photosynthesis It is authored by international scientists from several countries Australia Canada France India Israel Japan Netherlands Russia Spain UK and USA It begins with a discussion of the genetic potential and the expression of the chloroplast genome that is responsible for several key proteins involved in the electron transport processes leading to O₂ evolution proton release and the production of 2 NADPH and A TP needed for CO₂ fixation The section on photosystems discusses 2 how photosystem I functions to produce NADPH and how photosystem II oxidizes water and releases protons through an oxygen clock and how intermediates between the two photosystems are produced involving a two electron gate

Current challenges in photosynthesis: From natural to artificial Harvey J.M. Hou, Suleyman I. Allakhverdiev, Mohammad Mahdi Najafpour, Govindjee, 2014-10-03.

Jules Verne (1828-1905), author of *Around the World in Eighty Days* (1873) and *Journey to the Center of the Earth* (1864), wrote in 1875: "I believe that water will one day be used as a fuel because the hydrogen and oxygen which constitute it, used separately or together, will furnish an inexhaustible source of heat and light. I therefore believe that when coal, oil deposits are oxidised, we will heat ourselves by means of water. Water is the fuel of the future. Solar energy is the only renewable energy source that has sufficient capacity for the global energy need; it is the only one that can address the issues of energy crisis and global climate change. A vast amount of solar energy is harvested and stored via photosynthesis in plants, algae and cyanobacteria since over 3 billion years. Today it is estimated that photosynthesis produces more than 100 billion tons of dry biomass annually, which would be equivalent to a hundred times the weight of the total human population on our planet at the present time and equal to a global energy storage rate of about 100 TW. The solar power is the most abundant source of renewable energy and oxygenic photosynthesis uses this energy to power the planet using the amazing reaction of water splitting. During water splitting, driven ultimately by sunlight, oxygen is released into the atmosphere and this, along with food production by photosynthesis, supports life on our earth. The other product of water oxidation is hydrogen, protons and electrons. This hydrogen is not normally released into the atmosphere as hydrogen gas but combined with carbon dioxide to make high

energy containing organic molecules When we burn fuels we combine these organic molecules with oxygen The design of new solar energy systems must adhere to the same principle as that of natural photosynthesis For us to manipulate it to our benefit it is imperative that we completely understand the basic processes of natural photosynthesis and chemical conversion such as light harvesting excitation energy transfer electron transfer ion transport and carbon fixation Equally important we must exploit application of this knowledge to the development of fully synthetic and or hybrid devices Understanding of photosynthetic reactions is not only a satisfying intellectual pursuit but it is important for improving agricultural yields and for developing new solar technologies Today we have considerable knowledge of the working of photosynthesis and its photosystems including the water oxidation reaction Recent advances towards the understanding of the structure and the mechanism of the natural photosynthetic systems are being made at the molecular level To mimic natural photosynthesis inorganic chemists organic chemists electrochemists material scientists biochemists biophysicists and plant biologists must work together and only then significant progress in harnessing energy via artificial photosynthesis will be possible This Research Topic provides recent advances of our understanding of photosynthesis gives to our readers recent information on photosynthesis research and summarizes the characteristics of the natural system from the standpoint of what we could learn from it to produce an efficient artificial system i e from the natural to the artificial This topic is intended to include exciting breakthroughs possible limitations and open questions in the frontiers in photosynthesis research
