

Photoelectron Spectroscopy (PES) ANSWER KEY

1. In a photoelectron spectrum, photons of 165.7 MJ/mol strike atoms of an unknown element. If the kinetic energy of the ejected electrons is 25.4 MJ/mol, what is the ionization energy of the element?

$$\text{IE} = \text{Energy of Photons} - \text{KE of electrons} = 165.7 \text{ MJ/mol} - 25.4 \text{ MJ/mol} = 140.3 \text{ MJ/mol}$$

2. What determines the position and the height (intensity) of each peak in a photoelectron spectrum?

Position = Ionization Energy, height = relative number of electrons

3. Why is the distance of the energy level from the nucleus important in determining the corresponding peak position in the photoelectron spectrum?

When electrons are further from the nucleus, the interactions (Coulombic attractions) between the electrons and nucleus are weaker, so less energy is needed to remove them.

4. Based on the information provided below, draw a photoelectron spectrum for argon. Indicate the relative intensities and positions of all peaks.

e- conf	1s ²	2s ²	2p ⁶	3s ²	3p ⁴
IE (MJ/mol)	-309.0	-31.5	-24.1	-2.83	-1.52

5. Identify the element which produced the photoelectron spectrum shown below. Briefly explain your reasoning. Label each peak with the portion of the electron configuration that it represents.

Ionization of Solids by Heavy Particles Raul A. Baragiola, 2012-12-06. This book collects the papers presented at the NATO Advanced Research Workshop on Ionization of Solids by Heavy Particles held in Giardini Naxos Taormina, Italy, on June 1-5, 1992. The meeting was the first to gather scientists to discuss the physics of electron emission and other ionization effects occurring during the interaction of heavy particles with condensed matter. The central problem in the field is how to use observations of electron emission and final radiation damage to understand what happens inside the solid, like excitation mechanisms, the propagation of the electronic excitation along different pathways and surface effects. The ARW began with a brief survey of the field, stressing the unknowns. It was pointed out that ionization theories can only address the very particular case of weak perturbations. For this problem, this meant high-speed, low-charged projectiles; a perturbation treatment of interactions with slow, highly charged ions was later presented. Only semi-empirical models exist for velocities lower than the Fermi velocity in the solid, which can be used to predict kinetic electron emission yields. These models, however, do not address the basic questions about the mechanisms for electron excitation, transport and escape through the surface layer.

Materials Modelling Using Density Functional Theory Feliciano Giustino, 2014. The book explains the fundamental ideas of density functional theory and how this theory can be used as a powerful method for explaining and even predicting the properties of materials with stunning accuracy.

Implant Surfaces and their Biological and Clinical Impact Ann Wennerberg, Tomas Albrektsson, Ryo Jimbo, 2015-01-05. Common ways to

modify implant surfaces are described and methods for the evaluation of surface properties are presented in an easy to read style Experimental results that have contributed to surface modifications relevant for commercial available implants are presented with emphasis on in vivo and clinical studies While the focus is primarily on surface modifications at the micrometer and nanometer levels alterations at the millimeter level are also covered including thread designs and their possible influence on stress distribution In addition it is analyzed how surface alterations have changed the clinical long term results for certain groups of patients
