

# Photosynthesis

## The steps

1

### Light Absorption

Plant leaves contain a pigment called chlorophyll, which absorbs sunlight.

2

### CO<sub>2</sub> Uptake

Carbon dioxide is taken in by plants through tiny openings on leaves called stomata.

3

### Water Uptake

Plants absorb water from the soil through their roots and transport it to the leaves.

4

### The Reaction

Photosynthesis occurs in chloroplasts, where sunlight energy is used to transform water and carbon dioxide into glucose and oxygen.

5

### Glucose Production and Oxygen Release

Photosynthesis produces glucose, which is the primary source of energy for plants, and releases oxygen as a byproduct through stomata into the air.

Kantrud,1991      **Learning Directory** ,1972      **Seagrasses of Australia** Anthony W. D. Larkum,Gary A. Kendrick,Peter J. Ralph,2018-07-27 This book takes the place of *Biology of Seagrasses A Treatise on the Biology of Seagrasses with Special Reference to the Australian Region* co edited by A W D Larkum A J MaCComb and S A Shepherd and published by Elsevier in 1989 The first book has been influential but it is now 25 years since it was published

and seagrass studies have progressed and developed considerably since then. The design of the current book follows in the steps of the first book. There are chapters on taxonomy, floral biology, biogeography and regional studies. The regional studies emphasize the importance of Australia having over half of the world's 62 species, including some ten species published for Australia since the previous book. There are a number of chapters on ecology and biogeography, fish biology and fisheries and dugong biology are prominent chapters. Physiological aspects again play an important part, including new knowledge on the role of hydrogen sulphide in sediments and on photosynthetic processes. Climate change, pollution and environmental degradation this time gain an even more important part of the book. Decline of seagrasses around Australia are also discussed in detail in several chapters. Since the first book was published, two new areas have received special attention: blue carbon and genomic studies. Seagrasses are now known to be a very important player in the formation of blue carbon, i.e. carbon that has a long turnover time in soils and sediments. Alongside salt marshes and mangroves, seagrasses are now recognized as playing a very important role in the formation of blue carbon. And because Australia has such an abundance and variety of seagrasses, their role in blue carbon production and turnover is of great importance. The first whole genomes of seagrasses are now available and Australia has played an important role here. It appears that seagrasses have several different suites of genes as compared with other land plants and even in comparison with freshwater hydrophytes. This difference is leading to important molecular biological studies where the new knowledge will be important to the understanding and conservation of seagrass ecosystems in Australia. Thus, by reason of its natural abundance of diverse seagrasses and a sophisticated seagrass research community in Australia, it is possible to produce a book which will be attractive to marine biologists, coastal scientists and conservationists from many countries around the world.
