

In 1902, Philip E. A Lenard made experiments to understand the situation how the extracted photoelectrons energy depends on the intensity of light. To do so, he used a carbon arc lamp that can set up into different light intensities and lighten a metal solid surface. Additionally, he used a second metal plate to keep the electrons and bound it to the cathode part of circuit system. It made the keeper plate charged negatively and a thrust between photoelectrons and the collector plate. So it means not all the electrons can reach collector plate unless they do not have enough kinetic energy. In addition, if the voltage occurring from battery in the system is increased, the photoelectrons cannot reach the plate after one point of voltage. And, that voltage must be equal to the maximum kinetic energy of photoelectrons.

Figure 1.a: The experimental set up of Lenard's photoelectric effect experiment.<sup>2</sup>

The results of Lenard experiment show that the stopping potential (Voltage to prevent photoelectrons to reach collector plate) does not depend on the intensity of light. The situation can not be explained with the electromagnetic theory, and another problem occurred when the different wavelength of lights used as independent variable. Because kinetic energy of the photoelectrons increased when the frequency of light increased (1).

The inexplicable results was explained in a different way of thinking, that the energy of light kept in small energy packages by Albert Einstein who assumes the light is made up from quanta that have "velocity multiplied by Planck constant " amount of energy. Moreover, the energy of a photon is depend on its frequency. With this idea, the results of Lenard's experiment can be explainable and it is still common in physics. Despite the fact that Rober Andrews Milikan was trying to contradict the assumption of Albert Einstein –due to the assumption is against to the classic electromagnetic wave theory–, the only result that he gained from his experiment was some proves for the Einsteins theory and a close value for

Planck's constant based on formula for energy of photons. (  $E = h \cdot \nu$  )<sup>8</sup>

The Nature of Physical Computation Oron Shagrir,2022 Computing systems are ubiquitous in contemporary life Even the brain is thought to be a computing system of sorts But what does it mean to say that a given organ or system computes What is it about laptops smartphones and nervous systems that they are deemed to compute and why does it seldom occur to us to describe stomachs hurricanes rocks or chairs that way These questions are key to laying the conceptual foundations of computational sciences including computer science and engineering and the cognitive and neural sciences Oron Shagrir here provides an extended argument for the semantic view of computation which states that semantic properties are involved in the nature of computing systems The first part of the book provides general background Although different in scope these chapters have a common theme namely that the linkage between the mathematical theory of computability and the notion of physical computation is weak The second part of the book reviews existing non semantic accounts of physical computation Shagrir analyze three influential accounts in greater depth and argues that none of these accounts is satisfactory but each of them highlights certain key features of physical computation that he eventually adopts in his own semantic account of physical computation a view that rests on a phenomenon known as simultaneous implementation or indeterminacy of computation Shagrir completes the characterization of his account of computation and highlights the distinctive feature of computational explanations

**Universe** Philip Goff, 2023-10-10 Why are we here What s the point of existence On the big questions of meaning and purpose Western thought has been dominated by the dichotomy of traditional religion and secular atheism In this pioneering work Philip Goff argues that it is time to move on from both God and atheism Through an exploration of contemporary cosmology and cutting edge philosophical research on consciousness Goff argues for cosmic purpose the idea that the universe is directed towards certain goals such as the emergence of life In contrast to religious thinkers Goff argues that the traditional God is a bad explanation of cosmic purpose Instead he explores a range of alternative possibilities for accounting for cosmic purpose from the speculation that we live in a computer simulation to the hypothesis that the universe itself is a conscious mind Goff scrutinizes these options with analytical rigour laying the foundations for a new paradigm of philosophical enquiry into the middle ground between God and atheism Ultimately Goff outlines a way of living in hope that cosmic purpose is still unfolding involving political engagement and a non literalist interpretation of traditional religion
