## How Do Plants Use the Energy from the Sun?

Plants make \_\_\_\_\_ by using energy from \_\_\_\_\_. The plant transforms \_\_\_\_\_ ( $\text{CO}_2$ ) from the air and water ( $\text{H}_2\text{O}$ ) taken from the ground by roots into \_\_\_\_\_ ( $\text{C}_6\text{H}_{12}\text{O}_6$ ) and \_\_\_\_\_ ( $\text{O}_2$ ). This unique process is called **photosynthesis**. The process itself occurs in the \_\_\_\_\_ of the plant cell. Plants can take in  $\text{CO}_2$  through tiny openings called stomata on their leaves. Guard cells on the leaves open and close the stomata.

**Cellular \_\_\_\_\_** is when a plant and animal cell breaks down simple sugars into  $\text{CO}_2$  and water. This process releases energy in the form of adenosine triphosphate (ATP). The \_\_\_\_\_ is used for all processes within a cell that need \_\_\_\_\_. Think of it as an energy bar for the cell. The process of cellular respiration occurs in the \_\_\_\_\_.

In science, a chemical reaction is a process in which one or more substances, the reactants, are converted to one or more different substances, which are separated into products. Think of reactants as the ingredients in a recipe, and the product is the meal. Reactants are substances that start the chemical reaction. A product is a substance, but one that is produced at the end of the reaction. The \_\_\_\_\_ between reactants and products in a chemical reaction can be written as follows:

## Key Points

The arrow ( $\rightarrow$ ) represents the direction in which the reaction occurs. Please note that sometimes, the reaction can occur in the opposite direction.

Pollock, 1998      Plant Respiration Hans Lambers, Universitat Illes Balears, 2005-07-05 Respiration in plants as in all living organisms is essential to provide metabolic energy and carbon skeletons for growth and maintenance As such respiration is an essential component of a plant's carbon budget Depending on species and environmental conditions it consumes 25-75% of all the carbohydrates produced in photosynthesis even more at extremely slow growth rates Respiration in plants can also proceed in a manner that produces neither metabolic energy nor carbon skeletons but heat This type of respiration involves the cyanide resistant alternative oxidase it is unique to plants and resides in the mitochondria The activity of this alternative pathway can be measured based on a difference in fractionation of oxygen isotopes between the cytochrome and the alternative oxidase Heat production is important in some flowers to attract pollinators however the alternative oxidase also plays a major role in leaves and roots of most plants A common thread throughout this volume is to link respiration including alternative oxidase activity to plant functioning in different environments      **The Effect of Laboratory Experimentation Along with Graphical and Data Analysis on the Learning of Photosynthesis and Cellular Respiration in a High School Biology Classroom** Marie Lynn Jasper, 2007      **Photosynthesis and Respiration** William G.
