

Photosynthesis: What's in a Leaf?

What is the relationship between structure and function in a leaf?

Why?

What would the world be like without leaves—no grass for ball fields, no beautiful landscaping? It would also mean no oxygen for animals and no food for heterotrophs. Leaves are like living machines that recycle the carbon and oxygen in our environment. This process, driven by the sun's energy, allows for a constant supply of oxygen and food for the inhabitants of Earth.

The Leaf: A Platform for Performing Photosynthesis William W. Adams III, Ichiro Terashima, 2018-10-24 The leaf is an organ optimized for capturing sunlight and safely using that energy through the process of photosynthesis to drive the productivity of the plant and through the position of plants as primary producers that of Earth's biosphere. It is an exquisite organ composed of multiple tissues each with unique functions working synergistically to 1 deliver water nutrients signals and sometimes energy rich carbon compounds throughout the leaf xylem 2 deliver energy rich carbon molecules and signals within the leaf during its development and then from the leaf to the plant once the leaf has matured phloem 3 regulate exchange of gasses between the leaf and the atmosphere epidermis and stomata 4 modulate the radiation that penetrates into the leaf tissues trichomes the cuticle and its underlying epidermis 5 harvest the energy of visible sunlight to transform water and carbon dioxide into energy rich sugars or sugar alcohols for export to the rest of the plant palisade and spongy mesophyll and 6 store sugars and or starch during the day to feed the plant during the night and or acids during the night to support light driven photosynthesis during the day palisade and spongy mesophyll. Various regulatory controls that have been shaped through the evolutionary history of each plant species result in an incredible diversity of leaf form across the plant kingdom. Genetic programming is also flexible in allowing acclimatory phenotypic adjustments that optimize leaf functioning in response to a particular set of environmental conditions and biotic influences experienced by the plant. Moreover leaves and the primary processes carried out by the leaf respond to changes in their environment and the status of the plant through multiple regulatory networks over time scales ranging from seconds to seasons. This book brings together the findings from laboratories at the forefront of research into various aspects of leaf function with particular emphasis on the relationship to photosynthesis.

Dynamics of Leaf Photosynthesis Agu Laik, Vello Oja, 1998 Details a novel approach to dynamic as opposed to steady state analysis of leaf photosynthesis. Photosynthesis during leaf development Zdeněk Šesták, 1985. **A Leaf in Time** David Walker, 2002. **Photosynthesis** G. Garab, 1998 Photosynthesis is a process on which virtually all life on Earth depends. To answer the basic questions at all levels of complexity from molecules to ecosystems and to establish correlations and interactions between these levels photosynthesis research perhaps more than any other discipline in biology requires a multidisciplinary approach. Congresses probably provide the only forums where progress throughout the whole field can be overviewed. The Congress proceedings give faithful pictures of recent advances in photosynthesis research and outline trends and perspectives in all areas ranging from molecular events to aspects of photosynthesis on the global scale. The Proceedings Book a set of 4 or 5 volumes is traditionally highly recognized and intensely quoted in the literature and is found on the shelves of most senior scientists in the field and in all major libraries.

Dynamic model of leaf photosynthesis with acclimation to light and nitrogen J H M (John) Thornley, 1998 A simple model of photosynthesis in a mature C₃ leaf is described based on a non rectangular hyperbola the model allows the high light asymptote of that equation P_{max} to respond dynamically to light and nitrogen This causes the leaf light response equation to acclimate continuously to the current conditions of light and N nutrition which can vary greatly within a crop canopy and through a growing season with important consequences for gross production Predictions are presented for the dynamics of acclimation acclimated and non acclimated photosynthetic rates are compared and the dependence of leaf properties on light and N availability is explored There is good correspondence of predictions with experimental results at the leaf level The model also provides a mechanism for a down regulation of photosynthesis in response to increased carbon dioxide concentrations whose magnitude will depend on conditions particularly of nitrogen nutrition *Mathematical Modeling and Simulation of the Photosynthesis in a Plant Leaf Cell* Pinyo Yonthanthum, 2016 *Photosynthesis* Alvin Silverstein, Virginia B.
