Tsutsui, Heinrich Dirksen, 2022-09-27 Demand for crustacean production is increasing significantly throughout the world and crustacean production from capture fisheries has almost stagnated Aquaculture is the only possibility to meet this ever growing demand for crustaceans Still many commercially important crustaceans are being captured from the wild while breeding and seed production technologies are not available for these species The bottleneck in the successful breeding of crustacean species is mainly due to the non availability of information about reproductive biology Studies on crustacean reproduction will shed new light on understanding the mechanism of sex determination and differentiation meanwhile the application of innovative techniques will vitally contribute to the progress of the crustacean industry The research findings on crustacean reproduction will directly benefit aquaculture for successful captive breeding and seed production Here we are gathering both original research and review papers with the scope of the research topic including but not limited to Mechanism of sex determination sexual differentiation and gonadal development in crustaceans Other life functions e g endocrine nutrition immunity heredity involved in reproduction in crustaceans Applications of modern endocrinological and molecular approaches contributed to crustacean reproduction

Control Mechanisms in the Nervous System Abel Lajtha, 2013-04-17 The explosive accumulation of new knowledge in the biological sciences in the last decades has advanced our understanding of the basic mechanisms that underlie most biological phenomena These advances however have not been uniform but have varied considerably among the different biological problems In some cases e g biochemical genetics radical advances have been made which have changed our ideas and our approaches In other cases even with work which has yielded much detailed new knowledge our understanding of basic mechanisms remains very inadequate Among the lines of work that have not yet led to dramatic conceptual advances is the problem of control of biological activities This problem is of course basic both to any full understanding of life as a whole and to any real understanding of its most minute phenomena Indeed the myriad of biological activities that we can observe by direct or indirect means are all under the sway of most exquisitely precise mechanisms Any malfunctioning of these mechanisms has serious consequences not only for the particular function itself but for all the related and interlinked activities

Therapeutic potential of natural products in oxidative and metabolic diseases Ochuko Lucky Erukainure, Aliyu Muhammad, Erukainure, Aliyu Muhammad, Chika Ifeanyi Chukwuma, Md Shahidul Islam, Olakunle Sanni, Veronica Folakemi Salau, 2024-04-26 Oxidative and metabolic diseases represent a large proportion of global challenges to health and quality of life. These diseases are often characterised by the imbalance between the cellular prooxidant products of metabolic processes and the antioxidant molecules within the cells. The imbalance often led to the underlying factors that exacerbate the pathogenesis of some life threatening diseases such as carcinogenesis, obesity, diabetes and cardiovascular diseases. Natural products including phytochemicals and functional foods are known for their ability to affect metabolic processes such as ameliorating reactive oxygen species induced mitochondria dysfunction, mitigating inflammatory response and other cellular functions that could ameliorate the disease developments. Despite the relatively low toxicities of natural products as compared with synthetic products, further studies are still required to optimize the bioavailability, therapeutics, pharmaceuticals and clinical trials of natural products in patients suffering oxidative and metabolic diseases.

Deep Homology? Lewis I. Held, Jr, 2017-01-28 Humans and flies look nothing alike yet their genetic circuits are remarkably similar. Here Lewis I. Held Jr compares the genetics and development of the two to review the evidence for deep homology, the biggest discovery from the emerging field of evolutionary developmental biology. Remnants of the operating system of our hypothetical common ancestor 600 million years ago are compared in chapters arranged by region of the body from the nervous system, limbs and heart to vision, hearing and smell. Concept maps provide a clear understanding of the complex subjects addressed while encyclopaedic tables offer comprehensive inventories of genetic information. Written in an engaging style with a reference section listing thousands of relevant publications, this is a vital resource for scientific researchers and graduate and undergraduate students.

Ontogeny and Phylogeny of Brain Barrier Mechanisms Norman R Saunders, Helen B Stolp, Shane A Liddelow, 2016-04-15

The brain functions within an internal environment that is determined and controlled by morphological structures and cellular mechanisms present at interfaces between the brain and the rest of the body. In vertebrates these interfaces are across cerebral blood vessels, blood-brain barrier, choroid plexuses, blood-cerebrospinal fluid barrier, and pia-arachnoid. There is a CSF-brain barrier in the neuroepithelium lining the ventricular system that is only present in embryos. There is now substantial evidence that many brain barrier mechanisms develop early and that in some cases they are functionally more active and even more specialized compared to adult barriers. Therefore barriers in developing brain should be viewed as adapted appropriately for the growing brain and not as is still widely believed immature. Considerable advances in our understanding of these barrier mechanisms have come from studies of the developing brain and invertebrates. A striking aspect to be highlighted in this special edition is that many of the molecular mechanisms in these very diverse species are similar despite differences in the cellular composition of the interfaces. This Frontiers Topic comprises articles in three sections: Original studies, Reviews, and Myths/Misconceptions. Original articles provide new information on molecular and cellular barrier mechanisms in developing brains of primates including human embryos (Brchner et al, Ek et al, Errede et al), rodents (Bauer et al, Liddelow, Strazielle, Ghera, Saunders et al, Whish et al), chick (Bueno et al) and zebrafish (Henson et al) as well as studies in *Drosophila* (Hindle, Bainton, De Salvo et al, Limmer et al). The Reviews section includes evolutionary perspectives of the blood-brain and blood-CSF barriers (Bueno et al, Bill Kozh). There are also detailed reviews of the current state of understanding of different interfaces and their functional mechanisms in developing brain (Bauer et al, Strazielle, Ghera, Liddelow, Richardson et al, Errede et al, Henson et al, Brchner et al) and in invertebrates (Hindle, Bainton, De Salvo et al, Limmer et al). Different aspects of the relationship between properties of the internal environment of the brain and its development are discussed (Stolp, Molnar, Johansson, Prasongchean et al). A neglected area, namely barriers over the surface of the brain during development, is also covered (Brchner et al). Clinically related perspectives on barrier disruption in neonatal stroke are provided by Kratzer et al and other aspects of dysfunction by Morretti et al and by Palmeta et al on the continuing problem of bilirubin toxicity. Progress in this field is hampered by many prevailing myths about barrier function combined with methodologies that are not always appropriately selected or interpreted. These are covered in the Misconceptions, Myths, and Methods section including historical aspects and discussion of the paracellular pathway, a central dogma of epithelial and endothelial biology (Saunders et al) and a review of markers used to define brain barrier integrity in development and in pathological conditions (Saunders et al). Use of inappropriate markers has caused considerable confusion and unreliable interpretation in many published studies. Torbett et al deal with the

complexities of the new field of applying proteomics to understanding blood brain barrier properties as do Huntley et al with respect to applying modern high throughput gene expression methods Huntley et al The Editorial summarizes the contributions from all authors This includes mention of some the main unanswered but answerable questions in the field and what the impediments to progress may be Vertebrates: Comparative Anatomy, Function, Evolution Kenneth Kardong, 2006 This one semester text is designed for an upper level majors course Vertebrates features a unique emphasis on function and evolution of vertebrates complete anatomical detail and excellent pedagogy Vertebrate groups are organized phylogenetically and their systems discussed within such a context Morphology is foremost but the author has developed and integrated an understanding of function and evolution into the discussion of anatomy of the various systems
