## Photosynthesis

**The need for energy drives interactions between living organisms**

### Interdependence

Living organisms rely and interact with one another.

The most important interaction is the search for energy or food as this is essential to sustain life.

### The sun is the ultimate source of energy

The sun is the source of energy for all living things.

The sun gives energy in the form of light and heat → **Radiant energy**

Living organisms can't use this radiant energy directly; it needs to be transformed into a different form.

This transformation process is called **photosynthesis**.

### The process of photosynthesis

Photosynthesis is therefore taking radiant energy from the sun (light) as well as carbon dioxide, converting it into potential energy (energy that is stored in an object) which is stored in food and released as oxygen. When animals eat plants, they consume energy made by the plants.

Plants use carbon dioxide (from the air), water (from the soil) and energy from the Sun in a series of chemical reactions to produce glucose (food). This process is called photosynthesis

**Carbon dioxide + water + sunlight → glucose + oxygen**

#### The conservation of energy

Energy can never be created or destroyed, it can only be transformed from one form to another.
