

## Photosynthesis and Cellular Respiration

Plants use two processes to make food for themselves. They are photosynthesis and cellular respiration. One is used during day and one is used during night. Calvin's explanation of when plants use these processes is that photosynthesis occurs when it is light, and cellular respiration occurs when it is dark. I agree with this because plants need light energy which comes from the sun to go through photosynthesis and at night, they use the glucose they'd made during day because the sunlight is gone. Photosynthesis is a process plants use during the day to break down resources to make food for themselves. This occurs in the chloroplasts of plant cells.

The resources they need are light energy, carbon dioxide, and water. Light energy travels to Earth by light waves from the sun. Carbon dioxide is taken in through tiny holes in leaves called stomata. Water is absorbed through their roots and travels from there, up to the leaves through tubes in the stem. When light energy, carbon dioxide, and water all get to the chloroplast, photosynthesis occurs. When light energy hits the carbon dioxide and water molecules, it is transformed into chemical energy and they all break up and rearrange to create glucose (a type of sugar). Oxygen is a waste product of photosynthesis and gets released with the glucose when the process is done.

The photosynthesis equation is  $\text{CO}_2$ (carbon dioxide)+ $\text{H}_2\text{O}$ (water)+light energy= $\text{C}_6\text{H}_{12}\text{O}_6$ (glucose) &  $\text{O}_2$ (oxygen). Cellular respiration is a process plants use at night for energy. This happens in the mitochondria's of plant cells. The resources needed for this are energy, carbon dioxide, water, and heat. Cellular respiration is the inverse of photosynthesis. The way this works is glucose and oxygen enter the mitochondria, which convert them into energy.
