

Cochran's Sample Size Formula

- The Cochran formula allows to calculate an ideal sample size given a desired level of precision, desired confidence level, and the estimated proportion of the attribute present in the population.
- Cochran's formula is considered especially appropriate in situations with large populations. A sample of any given size provides more information about a smaller population than a larger one, so there's a 'correction' through which the number given by Cochran's formula can be reduced if the whole population is relatively small.

- The Cochran formula is:

$$n_0 = \frac{Z^2 pq}{e^2}$$

Where: e is the desired level of precision (i.e. the margin of error),

p is the (estimated) proportion of the population which has the attribute in question,

q is $1 - p$.

The z value is found in a Z table.

Willmot, 2014-08-21 Student Solutions Manual to Accompany Loss Models From Data to Decisions Fourth Edition This volume is organised around the principle that much of actuarial science consists of the construction and analysis of mathematical models which describe the process by which funds flow into and out of an insurance system **The Wildlife Techniques Manual** Nova J. Silvy, 2012-03 A standard text in a variety of courses the Techniques Manual as it is commonly called covers every aspect of modern wildlife management and provides practical information for applying the hundreds of methods described in its pages To effectively incorporate the explosion of new information in the wildlife profession this latest edition is logically organized into a two volume set Volume 1 is devoted to research techniques and Volume 2 focuses on management methodologies **A Manual of Sampling Techniques** Ranjan Kumar Som, 1973 Single stage sampling Stratified single stage sampling Stratified multi stage sampling Miscellaneous topics *Associations' Publications in Print*, 1981 1981 in 2 v v 1 Subject index v 2 Title index Publisher title index Association name index Acronym index Key to publishers and distributors abbreviations **A Guide to Simulation** P. Bratley, B. L. Fox, L. E. Schrage, 2012-12-06 Simulation means driving a model of a system with suitable inputs and observing the corresponding outputs It is widely applied in engineering in business and in the physical and social sciences Simulation methodology draws on computer science statistics and operations research and is now sufficiently developed and coherent to be called a discipline in its own right A course in simulation is an essential part of any operations research or computer science program A large fraction of applied work in these fields involves simulation the techniques of simulation as tools are as fundamental as those of linear programming or compiler construction for example Simulation sometimes appears deceptively easy but perusal of this book will reveal unexpected depths Many simulation studies are statistically defective and many simulation programs are inefficient We hope that our book will help to remedy this situation It is intended to teach how to simulate effectively A simulation project has three crucial components each of which must always be tackled 1 data gathering model building and validation 2 statistical design and estimation 3 programming and implementation Generation of random numbers Chapters 5 and 6 pervades simulation but unlike the three components above random number generators need not be constructed from scratch for each project Usually random number packages are available That is one reason why the chapters on random numbers which contain mainly reference material follow the chapters dealing with experimental design and output analysis *Sampling Methods* Pascal Ardilly, Yves Tillé, 2006-02-08 When we agreed to share all of our preparation of exercises in sampling theory to create a book we were not aware of the scope of the work It was indeed necessary to compose the information type out the compilations standardise the notations and correct the drafts It is fortunate that we have not yet measured the importance of this project for this work probably would never

have been attempted In making available this collection of exercises we hope to promote the teaching of sampling theory for which we wanted to emphasise its diversity The exercises are at times purely theoretical while others are originally from real problems enabling us to approach the sensitive matter of passing from theory to practice that so enriches survey statistics The exercises that we present were used as educational material at the cole Nationale de la Statistique et de l Analyse de l Information ENSAI where we had successively taught sampling theory We are not the authors of all the exercises In fact some of them are due to Jean Claude Deville and Laurent Wilms We thank them for allowing us to reproduce their exercises It is also possible that certain exercises had been initially conceived by an author that we have not identified Beyond the contribution of our colleagues and in all cases we do not consider ourselves to be the lone authors of these exercises they actually form part of a common heritage from ENSAI that has been enriched and improved due to questions from students and the work of all the demonstrators of the sampling course at ENSAI
