Defining Periodontal Health Lindsey Williams,2022 Objective This pilot study aims to gather baseline clinical and patient reported data of individuals with periodontitis who underwent non surgical periodontal therapy to evaluate clinical outcomes gauge endpoints of periodontal therapy and determine if periodontal health has been achieved according to the health model described by Mariotti and Hefti The collected data will be used over time to ascertain clinical outcomes i e

tooth retention in painless function for the management of periodontal disease

Materials and Methods

Eighteen patients who declined periodontal surgical treatment following initial non surgical therapy were recruited from the Department of Periodontology at The Ohio State University College of Dentistry between September 2021 to March 2022 These participants were recruited to participate in a recall maintenance program that entailed non surgical periodontal maintenance therapy every three months Tooth survival periodontal stability and patient satisfaction were evaluated for this baseline data study and are planned for comparison after one year Biographic and demographic information was collected for each patient including patient age biologic sex education employment status and whether the patient possessed insurance Full mouth periodontal charting was completed during the initial data collection visit Clinical measures recorded included periodontal pocket depths gingival margin recession clinical attachment levels furcation involvement mobility and plaque score Probing depth statistical analysis was also extracted from AxiUm electronic dental health charts for each patient A health questionnaire was constructed by researchers to obtain patient demographics and assess various measures of periodontal health including participant s ability to function perception of the health of their gums satisfaction with the appearance of their gums and smile and characteristics of their smile that are dissatisfying Data collected from questionnaires and clinical measurements was organized into a spreadsheet format and descriptive data was analyzed using frequency distributions numbers and percentages measures of central tendency means and measures of dispersion standard deviation

Utilizing Electronic Dental Record Data to Track Periodontal Disease Change Jay Sureshbhai Patel,2020

Periodontal disease PD affects 42% of US population resulting in compromised quality of life the potential for tooth loss and influence on overall health Despite significant understanding of PD etiology limited longitudinal studies have investigated PD change in response to various treatments A major barrier is the difficulty of conducting randomized controlled trials with

adequate numbers of patients over a longer time Electronic dental record EDR data offer the opportunity to study outcomes following various periodontal treatments However using EDR data for research has challenges including quality and missing data In this dissertation I studied a cohort of patients with PD from EDR to monitor their disease status over time I studied retrospectively 28 908 patients who received comprehensive oral evaluation at the Indiana University School of Dentistry between January 1st 2009 and December 31st 2014 Using natural language processing and automated approaches we 1 determined PD diagnoses from periodontal charting based on case definitions for surveillance studies 2 extracted clinician recorded diagnoses from clinical notes 3 determined the number of patients with disease improvement or progression over time from EDR data We found 100% completeness for age sex 72% for race 80% for periodontal charting findings and 47% for clinician recorded diagnoses The number of visits ranged from 1 14 with an average of two visits From diagnoses obtained from findings 37% of patients had gingivitis 55% had moderate periodontitis and 28% had severe periodontitis In clinician recorded diagnoses 50% patients had gingivitis 18% had mild 14% had moderate and 4% had severe periodontitis The concordance between periodontal charting generated and clinician recorded diagnoses was 47% The results indicate that case definitions for PD are underestimating gingivitis and overestimating the prevalence of periodontitis Expert review of findings identified clinicians relying on visual assessment and radiographic findings in addition to the case definition criteria to document PD diagnosis
