**Non-Volatile Memory Database Management Systems** Joy Arulraj,Andrew Pavlo,2022-06-01 This book explores the implications of non volatile memory NVM for database management systems DBMSs The advent of NVM will fundamentally

change the dichotomy between volatile memory and durable storage in DBMSs. These new NVM devices are almost as fast as volatile memory but all writes to them are persistent even after power loss. Existing DBMSs are unable to take full advantage of this technology because their internal architectures are predicated on the assumption that memory is volatile. With NVM many of the components of legacy DBMSs are unnecessary and will degrade the performance of data intensive applications. We present the design and implementation of DBMS architectures that are explicitly tailored for NVM. The book focuses on three aspects of a DBMS: 1 logging and recovery, 2 storage and buffer management, and 3 indexing. First we present a logging and recovery protocol that enables the DBMS to support near instantaneous recovery. Second we propose a storage engine architecture and buffer management policy that leverages the durability and byte addressability properties of NVM to reduce data duplication and data migration. Third the book presents the design of a range index tailored for NVM that is latch free yet simple to implement. All together the work described in this book illustrates that rethinking the fundamental algorithms and data structures employed in a DBMS for NVM improves performance and availability, reduces operational cost and simplifies software development.

**Benchmarking Transaction and Analytical Processing Systems** Anja Bog, 2013-07-11

Systems for Online Transaction Processing (OLTP) and Online Analytical Processing (OLAP) are currently separate. The potential of the latest technologies and changes in operational and analytical applications over the last decade have given rise to the unification of these systems which can be of benefit for both workloads. Research and industry have reacted and prototypes of hybrid database systems are now appearing. Benchmarks are the standard method for evaluating, comparing and supporting the development of new database systems. Because of the separation of OLTP and OLAP systems, existing benchmarks are only focused on one or the other. With the rise of hybrid database systems, benchmarks to assess these systems will be needed as well. Based on the examination of existing benchmarks, a new benchmark for hybrid database systems is introduced in this book. It is furthermore used to determine the effect of adding OLAP to an OLTP workload and is applied to analyze the impact of typically used optimizations in the historically separate OLTP and OLAP domains in mixed workload scenarios.

**Databases in Telecommunications II** Willem Jonker, 2003-06-30

Just like the previous workshop at VLDB 1999 in Edinburgh, the purpose of this workshop is to promote telecom data management as one of the core research areas in database research and to establish a strong connection between the telecom and database research communities. As I wrote in the preface of those proceedings, data management in telecommunications is an interesting area of research given the fact that both service management and service provisioning are very data intensive and pose extreme requirements on data management technology. Given the feedback on the previous workshop, we decided to keep the same program set up for this workshop: an invited speaker, a collection of research papers, and a panel discussion. We received 18 good quality papers from which we selected 12 to construct a very interesting program. The program has been divided into four sections. The first section focuses on CDR data warehouse and data mining technology. Data warehousing and data mining around customer

usage data remains an important area of interest for telecommunication operators. The growing competition especially in the mobile market means that operators have to put more effort into customer retention and satisfaction. The second section focuses on performance issues around databases in telecommunication. Since telecommunication databases are characterized by their extreme requirements for example in terms of volumes of data to be processed or response times, high volume data management and embedded and real time data management are key aspects of the telecommunication data management problems in today's operational environments.

*Storage Systems* Alexander Thomasian, 2021-10-13. Storage Systems Organization Performance Coding Reliability and Their Data Processing was motivated by the 1988 Redundant Array of Inexpensive Independent Disks proposal to replace large form factor mainframe disks with an array of commodity disks. Disk loads are balanced by striping data into strips with one strip per disk and storage reliability is enhanced via replication or erasure coding which at best dedicates  $k$  strips per stripe to tolerate  $k$  disk failures. Flash memories have resulted in a paradigm shift with Solid State Drives (SSDs) replacing Hard Disk Drives (HDDs) for high performance applications. RAID and Flash have resulted in the emergence of new storage companies namely EMC, NetApp, SanDisk and Purestorage and a multibillion dollar storage market. Key new conferences and publications are reviewed in this book. The goal of the book is to expose students, researchers and IT professionals to the more important developments in storage systems while covering the evolution of storage technologies, traditional and novel databases and novel sources of data. We describe several prototypes: FAWN at CMU, RAMCloud at Stanford and Lightstore at MIT. Oracle's Exadata, AWS Aurora, Alibaba's PolarDB, Fungible Data Center and author's paper designs for cloud storage namely heterogeneous disk arrays and hierarchical RAID. Surveys storage technologies and lists sources of data measurements: text, audio, images and video. Familiarizes with paradigms to improve performance: caching, prefetching, log structured file systems and merge trees, LSMs. Describes RAID organizations and analyzes their performance and reliability. Conserves storage via data compression, deduplication, compaction and secures data via encryption. Specifies implications of storage technologies on performance and power consumption. Exemplifies database parallelism for big data analytics, deep learning via multicore CPUs, GPUs, FPGAs and ASICs e.g. Google's Tensor Processing Units.
