

Troubleshooting Centrifugal Pumps

Effective troubleshooting should be an integral part of any plant's equipment reliability and maintenance program. Before you examine the system, however, take time to review maintenance records. The performance history of your pumps will point you in the right direction. Also, pump operators can provide clues to what is happening. Troubleshooting should focus on these areas of investigation:

1. THE FOUNDATION

Poor foundations, grouting and baseplate design often cause problems.

2. DRIVER

Vibrations of the driver (motor, steam turbine, gearing) can be transmitted to other components.

3. MECHANICAL POWER TRANSMISSION

Excitations from the coupling area, especially because of driver misalignment or eccentrically bored cou-

pling hubs, can also be transmitted to other parts of the pump and/or system. Users should note any incorrect positioning of the driver and pump such that the distance between shaft ends (DBSE) exceeds the axial flexing limits of the coupling.

4. THE DRIVEN PUMP

Pump design has a major influence on the hydraulic interaction between the rotor and the casing and consequently the problems encountered. Misconceptions about pump thermal-growth can create problems.

5. SUCTION PIPING AND VALVES

Improper design and layout of suction piping and valves can create flow disturbances such as cavitation, intake vortexing or suction recirculation.

6. DISCHARGE PIPING AND VALVES

Unfavorable dynamic behavior of piping resulting from loads traceable to dynamic, static or thermal causes (including resonance excita-

tion) can create trouble.

7. INSTRUMENTATION FOR CONTROL OF PUMP FLOW

Pressure pulsations can result from control system-pump interaction during start-ups, periods of low flow and valve changes.

8. MAINTAINING ALIGNMENT

Once the alignment is established, dowels into the baseplate must hold the pump in alignment.

Troubleshooting centrifugal pumps begins with observing operating conditions at the site. While a myriad of problems can exist with any pumping system, here are some of the more typical scenarios, possible causes and corrective actions. ■

Ed Nelson has more than 40 years of experience with industrial pumping systems as a former end-user at a major petrochemical company, and today as a turbomachinery consultant. He is a member of the Pumps and Systems Editorial Advisory Board.

Cavitating-type Problems

A cavitating sound is heard in a pump that does not normally cavitate, and it is not clear whether it is pumping into the system.

POSSIBLE CAUSES

The suction piping layout is poor. There may be too many elbows in too many planes or not enough straight run before the suction flange of the pump.

Suction piping configuration causes fluid to rotate adversely when approaching impeller.

Flow rate is high enough above design that NPSH_a has increased above NPSH_r.

Pump is operating at a low-flow, producing suction recirculation in the impeller eye, resulting in a cavitation-like sound.

The suction screen is clogged.

Piping gaskets with undersized IDs have been installed—a common problem in installations of small pumps.

Pipelines are constricted because of buildup of corrosion materials.

CORRECTIVE ACTION

Redesign piping layout, using fewer elbows and laterals for tees, and have five or more diameters of straight pipe before suction flange.

Install enough straight run of suction piping, or install vanes in piping to break up prerotation.

Reduce flow rate to the level for which the pump was designed.

Install bypass piping back to suction vessel to increase flow through pump. Note: Bypass flow may have to be as high as 50% of design flow.

If screen is present, remove and clean it.

Install properly sized gaskets.

Replace deteriorated pipe.
