

c) Sketch the first four times the tip of the blade will be 300 feet off the ground, accurate to two decimal places.

Using the GDC, we find the graphs: $y = 345 + 145\sin\left(\frac{\pi}{4}(x - 0.5)\right)$ and $y = 300$ intersect at $(0.50517796, \dots, 300)$,

$(3.434227, \dots, 300)$, $(6.363279, \dots, 300)$, and $(9.292331, \dots, 300)$.

So the first 4 times the tip of the blade will be 300 feet off the ground are 0.50s, 3.43 s, 6.36s, and 9.29s.

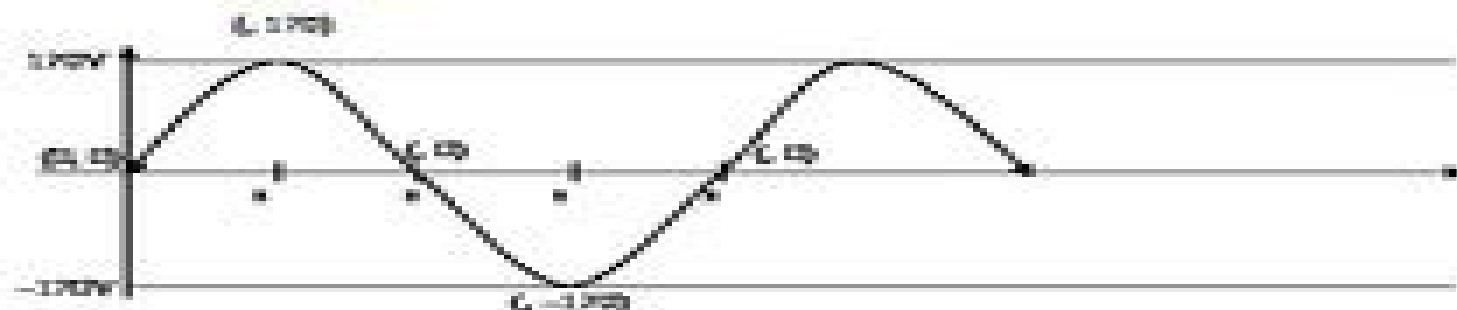

3. AC voltage The "120 Volt" in your house is actually a sine wave with an amplitude of about 170 volts. (The amount of power delivered varies with the voltage, so a sinusoid with an amplitude of 170 volts would deliver the same power as a DC power source of 120 volts.) The frequency of the electricity is 60 Hz, which means 60 cycles per second. (Some people call this the "beat" of fluorescent lights because they flicker as a result of this frequency.)

a) Knowing that the electricity cycles at 60 cycles per second, what is the period of the voltage wave in seconds?

A sinusoid \rightarrow $\frac{1}{60}$ second/cycle \rightarrow so the period is $\frac{1}{60}$ second.
60 cycles

b) Suppose we knew that at time zero, the voltage is zero. Sketch and label a graph of the voltage as a function of time. Make sure you label the x - and y -axes with all relevant information. (It should be very simple to read the coordinates of the "high time" directly off your graph.)

$$\frac{1}{60} - \frac{1}{60} = \frac{1}{60} \rightarrow \frac{1}{60} - \frac{1}{60} = \frac{1}{60} \rightarrow \frac{1}{60} - \frac{1}{60} = \frac{1}{60}$$

c) Write the equation of this sinusoid as a transformation of the function $y = \sin(x)$, with x in radians.

Sketch the graph, making the known time going up at 0.02s, we will say $x = 0$.

The amplitude is 170V.

The period is: $\frac{1}{60}$ second, so $2\pi = \frac{2\pi}{\frac{1}{60}} = \frac{2\pi}{1} = \frac{2\pi}{1} \cdot \frac{60}{1} = 120\pi$

The cosine has to be $\sin(x)$.

So one possible equation is: $y = 0 + 170\sin(120\pi(x - 0))$ or $y = 170\sin(120\pi x)$

d) Write the equation of this sinusoid as a transformation of the function $y = \cos(x)$, with x in radians.

The function has its maximum at $x = \frac{1}{60}$ so $c = \frac{1}{60}$

One possible equation is: $y = 170\cos(120\pi(x - \frac{1}{60}))$

e) At what time will the voltage first be at -120 volts?

Using the GDC, we graphed $y = 170\sin(120\pi x)$ and $y = -120$ intersect at $(0.433008148, \dots, -120)$ so at approximately 0.43s.

Smooth Particle Applied Mechanics: The State Of The Art William Graham Hoover,2006-11-02 This book takes readers through all the steps necessary for solving hard problems in continuum mechanics with smooth particle methods Pedagogical problems clarify the generation of initial conditions the treatment of boundary conditions the integration of the equations of motion and the analysis of the results Particular attention is paid to the parallel computing necessary for large problems and to the graphic displays including debugging software required for the efficient completion of computational projects The book is self contained with summaries of classical particle mechanics and continuum mechanics for both fluids and solids computer languages the stability of numerical methods Lyapunov spectra and message passing parallel computing The main difficulties faced by meshless particle methods are discussed and the means of overcoming them are illustrated with worked examples

Principles of Electric Circuits Thomas L. Floyd,2007 The eighth edition of this best selling dc ac circuits text represents significant positive changes for instructors and students alike As in prior editions Principles of Electric Circuits Eighth Edition retains its best features Comprehensive straightforward coverage of the basics of electrical components and circuits Clear explanations and applications of fundamental circuit laws and analysis in a variety of basic circuits with an emphasis on applications Extensive troubleshooting coverage

Electric Circuit Problems with Solutions F. A. Benson,2012-12-06 Electrical engineering and electronic engineering students have frequently to resolve and simplify quite complex circuits in order to understand them or to obtain numerical results and a sound knowledge of basic circuit theory is therefore essential The author is very much in favour of tutorials and the solving of problems as a method of education Experience shows that many engineering students encounter difficulties when they first apply their theoretical knowledge to practical problems Over a period of about twenty years the author has collected a large number of problems on electric circuits while giving lectures to students attending the first two post intermediate years of University engineering courses The purpose of this book is to present these problems a total of 365 together with many solutions some problems with answers given at the end of each Chapter are left as student exercises in the hope that they will prove of value to other teachers and students Solutions are separated from the problems so that they will not be seen by accident The answer is given at the end of each problem however for convenience Parts of the book are based on the author's previous work *Electrical Engineering Problems with Solutions* which was published in 1954
